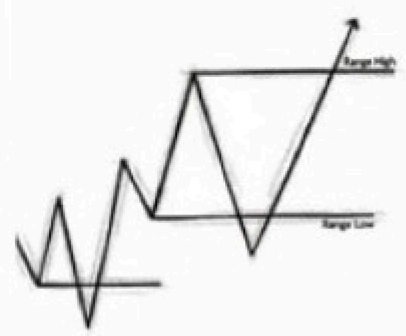
ICT RANGES



WHAT IS RANGES

- A Range is defined by a significant Swing High (Range High) and a Swing Low (Range Low) on any given timeframe.
- The Range High/Low are liquidity magnets (clusters of stop-loss orders) that institutions target for execution.
- The Equilibrium (50% midpoint) divides the Range into two zones: the Premium (above 50%) for selling, and the Discount (below 50%) for buying.
- Ranges are used to define directional bias and maintain the rule: Buy Low (in Discount), Sell High (in Premium).
- A clean break and close outside the Range High or Low signals Range Expansion, indicating a strong new move in that direction.

TYPES OF RANGES

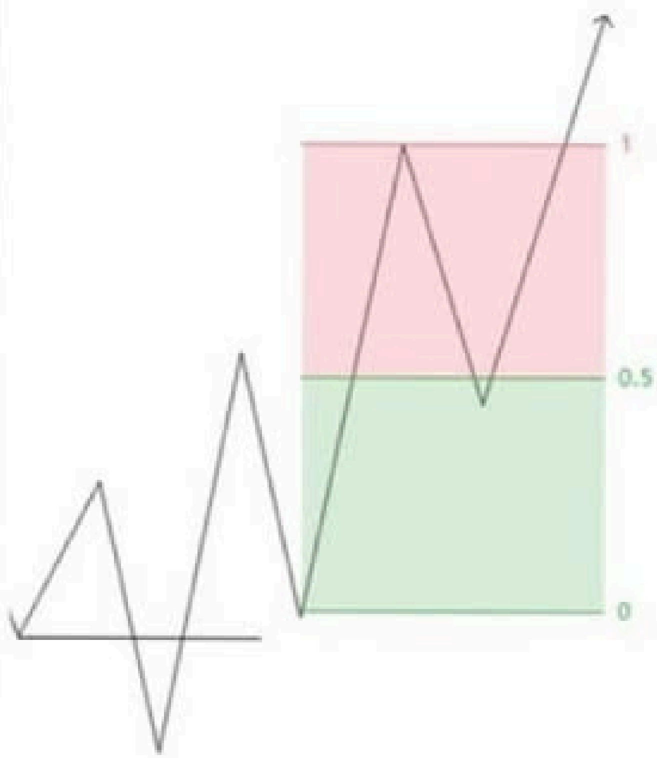
- **Dealing Range**: A major structural range (Swing High to Swing Low) defining macro Premium and Discount zones.

- **Previous Day's Range (PDR)**: The high and low of the prior day, serving as daily liquidity targets.

- **Weekly/Monthly Range**: Higher timeframe ranges (highs/lows) acting as significant long-term liquidity objectives.

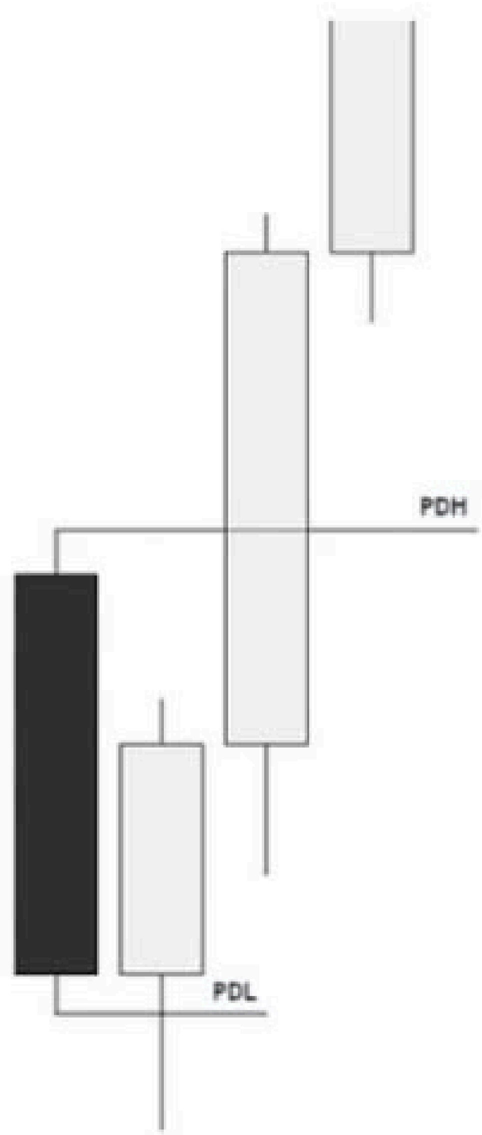
- **Session Ranges**: Time-specific ranges like the Asian Session Range, often manipulated for London/NY breakouts.

1.DEALING RANGE



- A Dealing Range is simply the area between a recent high and a recent low. It's the zone where price moves back and forth.
- This range shows where big players are collecting orders. They push price inside this box to trap both buyers and sellers.
- Liquidity builds up above the high and below the low. These are the places where traders put stop losses.
- Price usually breaks one side of the range first to grab that liquidity. This "fake move" helps smart money fill their positions.
- After grabbing liquidity, price delivers to the opposite side. Knowing this helps beginners understand market manipulation and catch the real move.

2.PREVIOUS DAY HIGHS AND LOWS



- Previous Day High (PDH) and Previous Day Low (PDL) are key reference points. They show where price reached its highest and lowest levels yesterday.

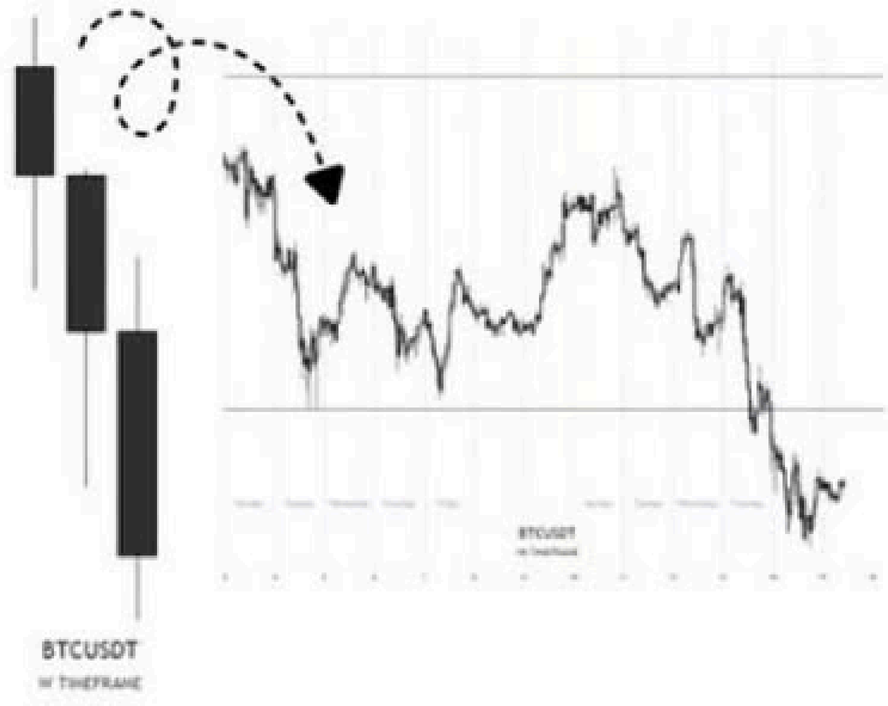
- Most retail traders place stop losses around these levels. That's why PDH/PDL naturally become liquidity zones.

- Smart money often targets these levels first. They sweep PDH/PDL to collect orders before making the real move.

- A break above PDH or below PDL doesn't always mean a trend. Many times it's just a liquidity grab, not a breakout.

- Watching how price reacts after taking PDH/PDL helps you judge direction. Rejection means reversal; clean break with structure shows continuation.

3.WEEKLY RANGES

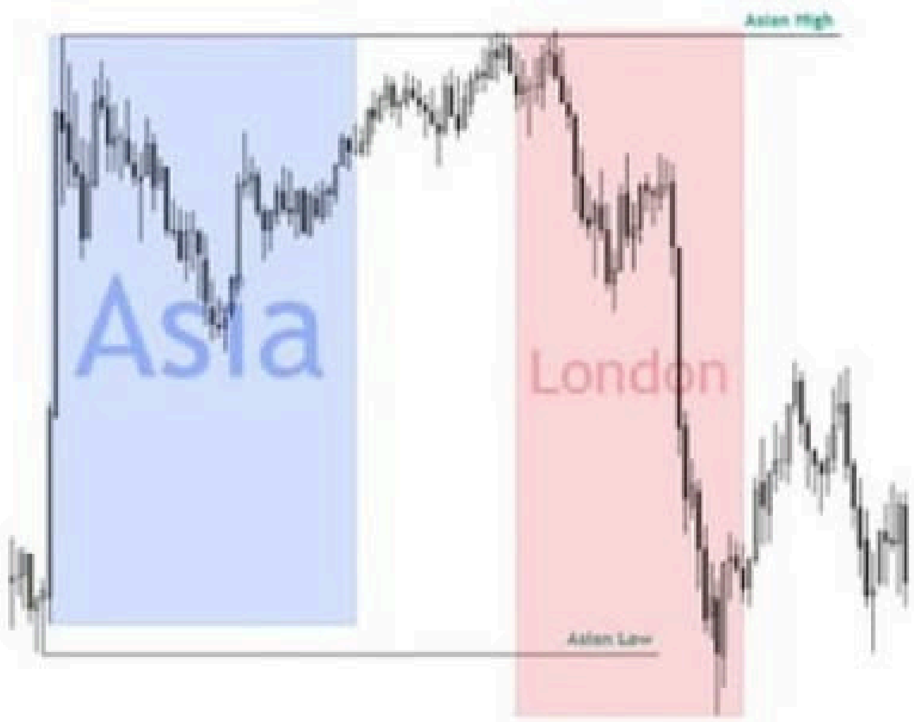


- Weekly range is the distance between that week's high and low. It shows the overall volatility of the week.
- Liquidity builds above the weekly high and below the weekly low. Many swing traders' stop losses sit here.
- Smart money often targets these extremes mid-week. They clear liquidity before choosing direction.
- A sweep of the weekly high/low can signal a potential reversal. Watch how price reacts after the sweep.
- Weekly ranges help you understand the higher-timeframe bias. They guide intraday trades with more accuracy.

MONTHLY RANGES

- Monthly range covers the high and low formed for the entire month. It's a major higher-timeframe structure.
- Liquidity pools are much larger at monthly highs/lows. Institutions use these levels for big positions.
- Monthly range sweeps often create major trend shifts. These moves usually affect the market for weeks.
- Price frequently hunts one side of the monthly range before delivering to the other. Classic ICT behavior.
- Using monthly range gives you long-term context. It helps align swing trades and avoid trading against the bigger move.

5.SESSION RANGES



- A session range is the high and low formed during a specific trading session (Asian, London, New York). It shows how price moved within that time window.
- Each session has its own volatility. Asian is usually slow, London expands, and New York creates the main move.
- Liquidity builds above the session high and below the session low. These levels get targeted first in the next session.
- Smart money often sweeps the Asian range during London. Then New York usually sweeps London's range before the real direction forms.
- Understanding session ranges helps time entries better. It tells you when market is accumulating, when it's taking liquidity, and when it's ready to deliver the true move.
