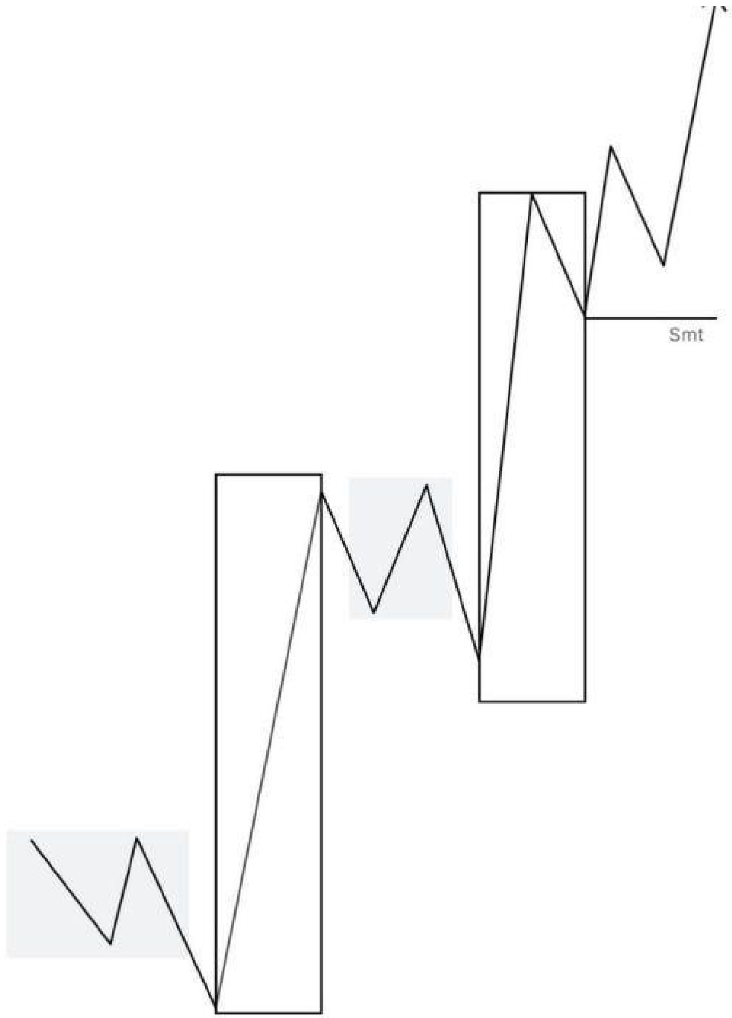
RANGE DYNAMICS

- Range= Generation of interest
- You will never find a market consolidating forever.

When price is in a clear defined range: Breakout traders are waiting for a break to the upside or downside.. that is why the first breakout of a range is usually a false one to trap them

**The market makers do not move price in vertical
as it is not wise and it is not possible as well because of the amounts traded.**

- The markets is always in two states.
- The market makers have to keep the market flowing in two states at all time. In a range and a trend.
- Every consolidation leads to an expansion.



STEP BY STEP

Draw out the high and low of the range

Locate a 4H/1H key level above or below the range

STEP 1

Wait for one end of the range to be purged or souped at a key time while testing the key level

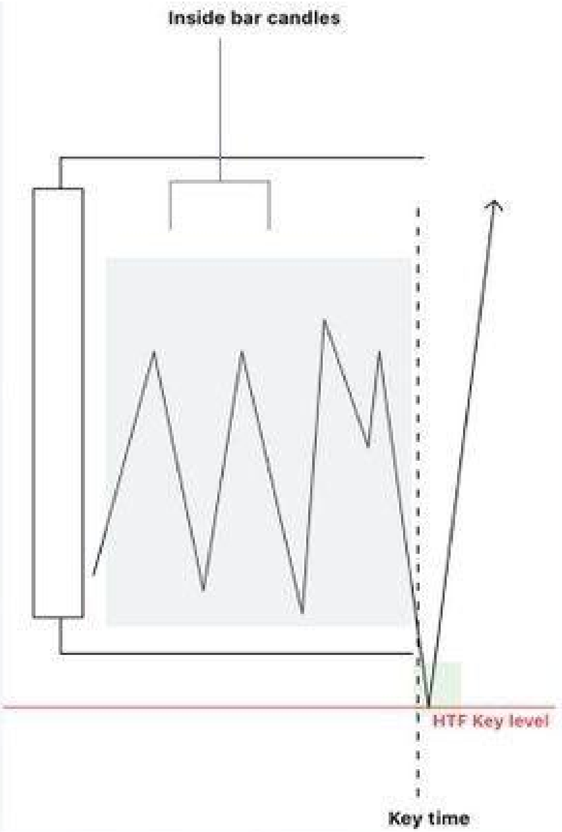
STEP 2

Wait for price to displace back into the Range

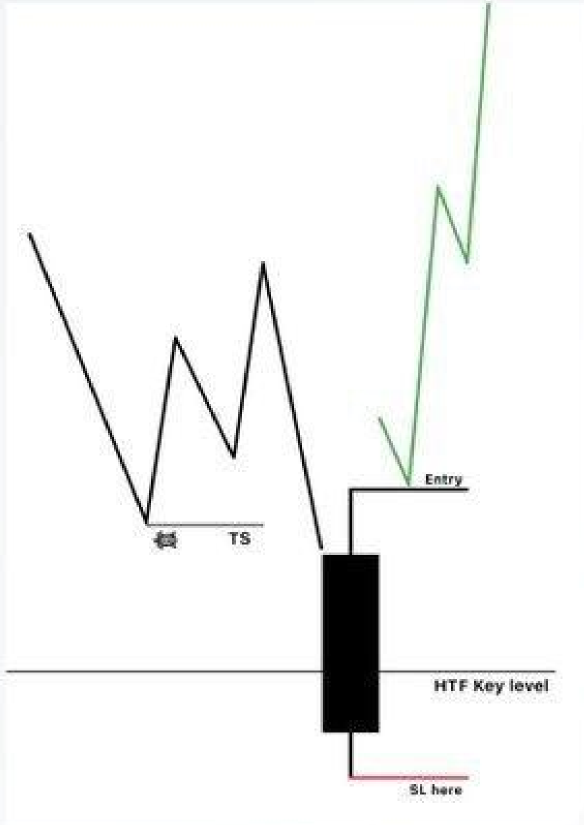
Look for a clear price displacement indicating a return into the range after liquidity is taken.

Find your lower time frame entry model on the 15min/5min time frame

STEP 3



Higher time frame



Lower Time frame

Higher timeframe key levels are The springs that produce lower timeframe expansions.

Step 1

Wait for one end of the range to be purged or souped at a key time while testing the key level

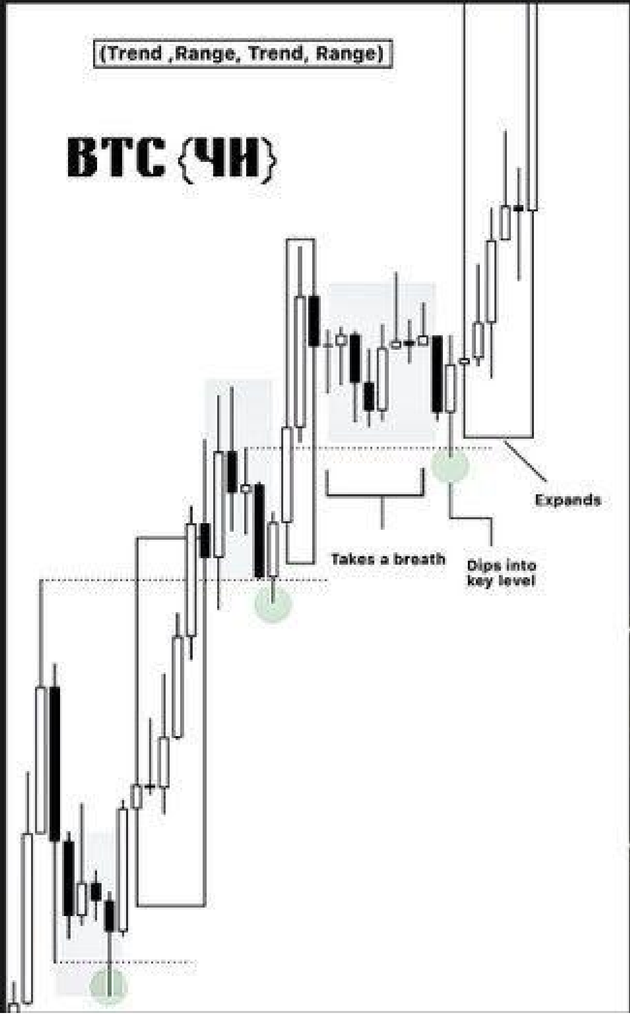
Expansion
Leg)
Thick Downclose bulky candle
That stabbed below an old low
=Bullish order block

- It is how the market makes generate liquidity through interest
- Accumulation of buyside and sellside liquidity

it’s also the market taking a breath before the next move



The 4 Golden rules

01

02

03

04

RULE 1

- Rule #1 Buy low sell high preserve capital by having a model that teaches you when not to trade
- Buy the range low rejections sell the range high rejections

RULE 2

- Don't buy the range high. Don't sell the range low do the opposite
- Target 1 50% of the range target 2 opposing end of the range

RULE 3

- Always take a partial at the 50% of the range
- Never participate in the middle of the range NEVER

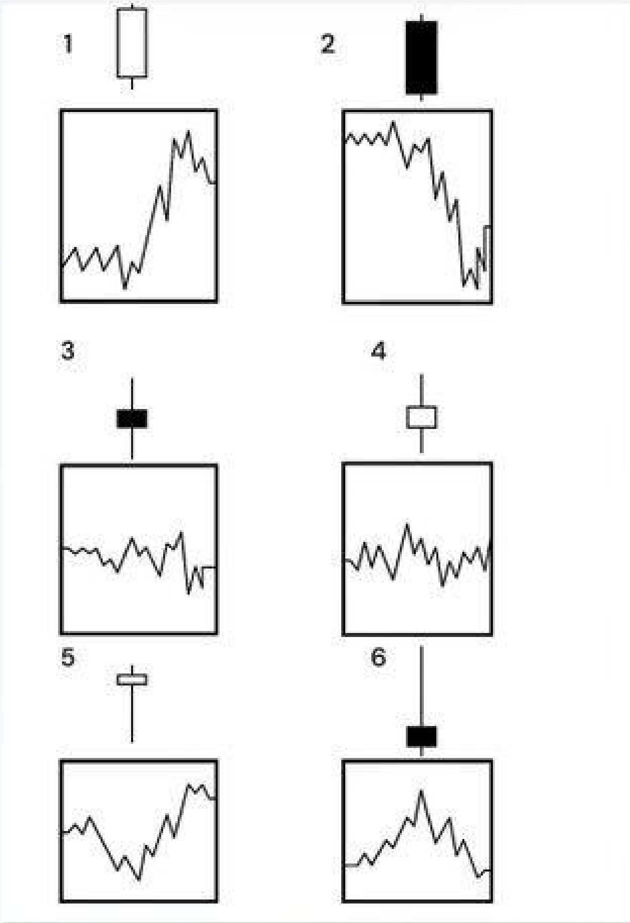
RULE 4

- When you're bearish; don't enter at once.

Wait for a bullish pop above an old high.

When you're bullish; don't enter at once.

Wait for a bearish dump below an old low.



In the world of trading, every candlestick tells a story. Yet, despite countless market scenarios, every candle formation falls into one of only six possible outcomes, shaped by four main structures. Imagine the power of understanding these patterns: they reveal market sentiment, hint at reversals, or signal trends. These six forms are the blueprint to mastering candlestick patterns, the key to interpreting price action and predicting movements

- Expansion (1&2)
- Consolidation (3&4)
- Retractement (5&6)
- Reversal (5&6).
