DAILY BIAS

Daily Bias

The expected daily market direction based on previous day's levels and liquidity analysis.

Mastering Daily Bias Made Easy

Grasping Daily Bias Is Simpler Than You Imagine

Focus on This Principle

If the price closes above the previous day's high (PDH), the next target is the new high
(continuation structure)

If the price closes below the previous day's low (PDL), the next target is the new low
(continuation structure)

If the price wicks above the PDH but closes below, aim for the new low
(reversal structure)

If the price wicks below the PDL but closes above, aim for the new high
(reversal structure)

Continuation Example

**On Tuesday, price closed above Monday's daily high.
On Wednesday we can anticipate price to target
Tuesday's high.**

Reversal Example

**On Tuesday, price closed above Monday's daily high.
On Wednesday we can anticipate price to target
Monday's Low.**

The Power of Understanding This

When price closes above the previous day's high (PDH) or below the previous day's low (PDL), it confirms strong market momentum in that direction, suggesting the trend will continue.

Conversely, if price wicks above PDH but closes below, or wicks below PDL but closes above, it indicates a rejection of those levels-a sign that the market may reverse direction, because of the inability to sustain beyond key levels.
