USER MANUAL

FX4 MODEL 2023/06

INTRODUCING MY FX4 MODEL

Introducing my favorite **london open framework**, 100% automated and free for the community based on ICT concepts. This model incorporates the previous day's high and low, along with 50% of that range, to provide you with the premium and discount zones.

FX4 Model use the **ICT Asian range**, which spans from 20:00 (New York time) to midnight open. This range is part of the accumulation range of the day, during which lot of orders have been placed during this time, making the high and the low of this range an important liquidity pool zone.

The model relies on a time-based dashboard. This dashboard displays some key information, such as the previous candle close and the remaining time before important candle closes (price and time).

With this tool you gain a powerful trading framework that gives you the ability to capitalize on simple trading opportunities.

THE FEATURES

Time-To-Close Dashboard

An amazing Dashboard that show you the Timeframe and his "Time-To-Close".

Previous Candle Close (**Bullish** or **Bearish**).

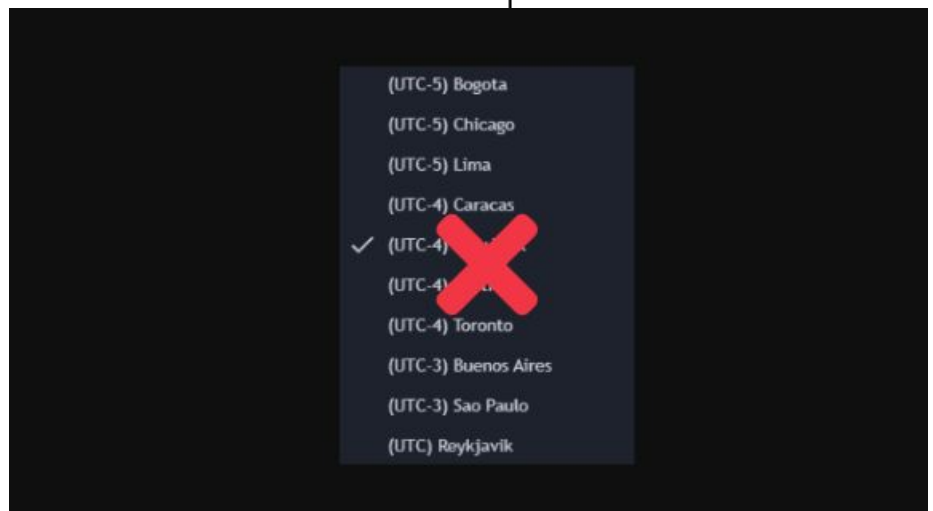

Time will show in **Red** when there are 5 min left before the candle close.

TF	Time-to-Close	PC
M15	13:40	Bearish
M30	28:40	Bullish
H1	28:40	Bullish
H4	28:40	Bearish
D	16:28:40	Bullish

Annotations: An arrow points to the 'TF' column header with the label 'Timeframe'. Another arrow points to the 'PC' column header with the label 'Previous Candle Close'. Below the table, the text '@toodegrees' and '@fx4_living' is visible.

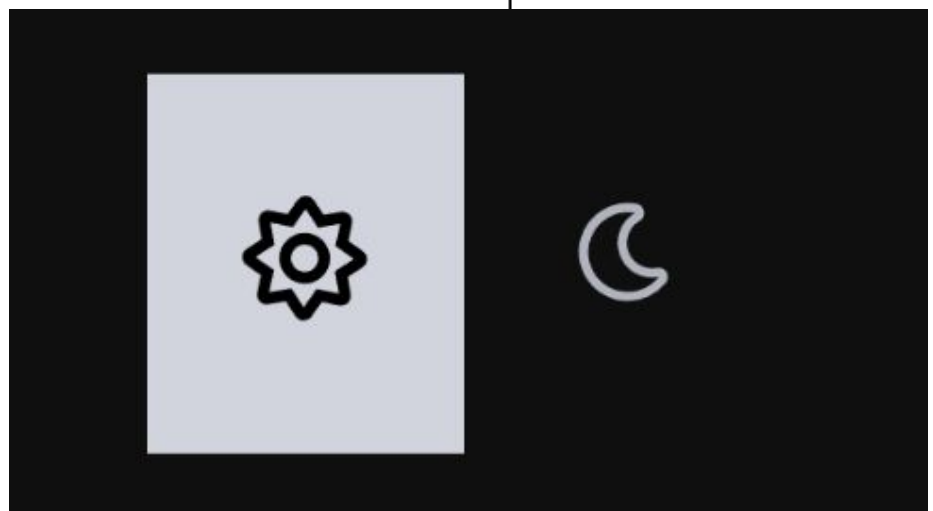

Automatic Timezone

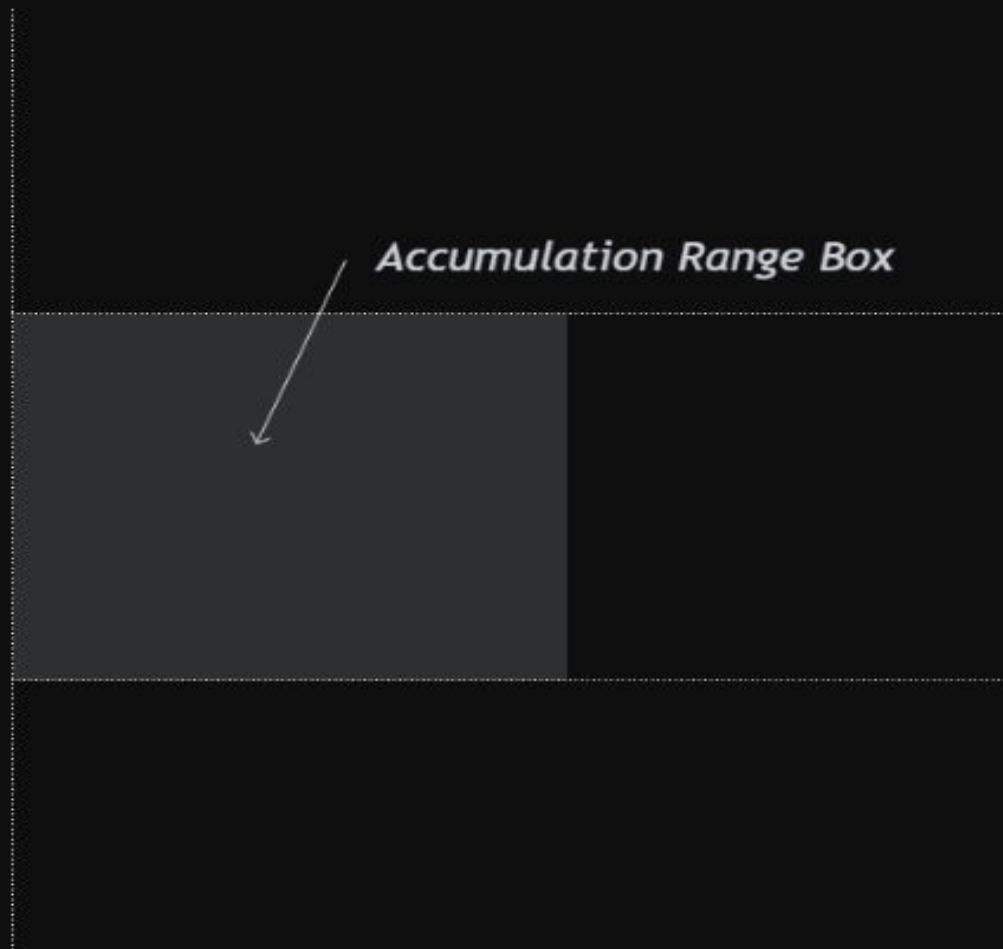

As the title implies, automated time zone means that you will never need to modify any GMT or hour, as everything is updated automatically even if you live in a Timezone other than the East Coast of the United States.

Automatic Dark/Light Mode

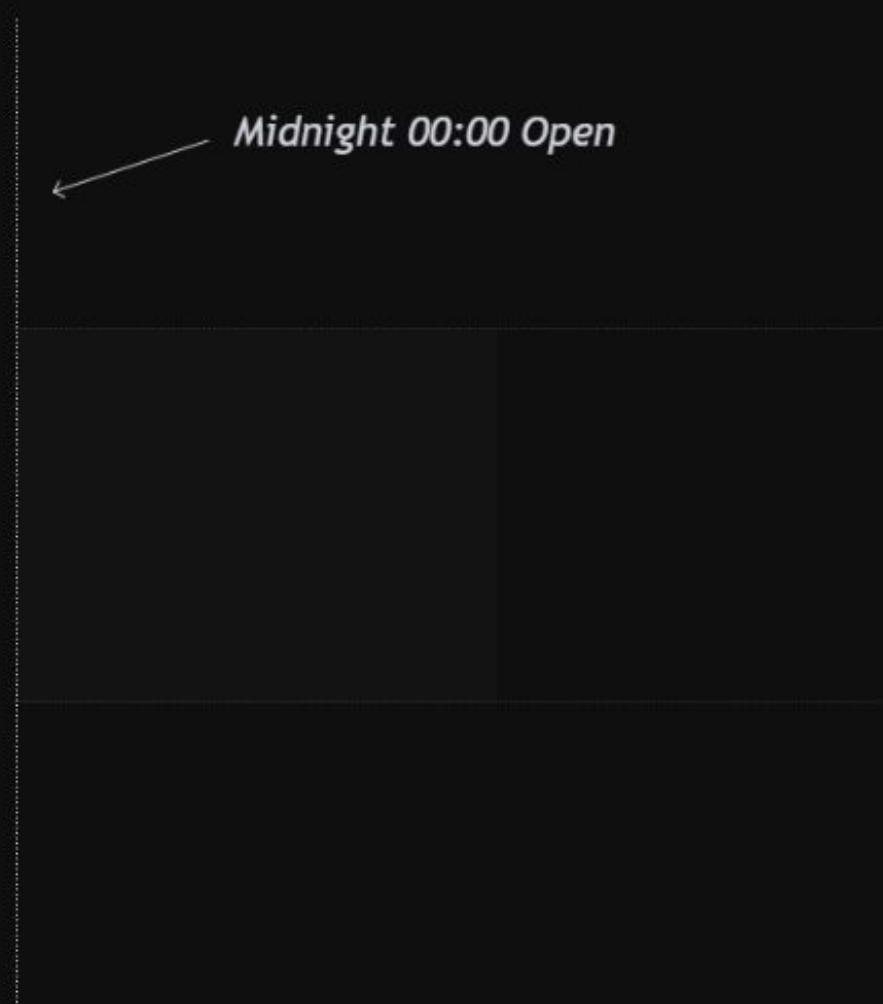

All of the graphics will change colour automatically based on your background, so you don't need to adjust any settings; they are designed to be consistent.

MY FX4 ACCUMULATION RANGE IS FROM THE PREVIOUS DAY CLOSE TO 2 AM NY LOCAL TIME.

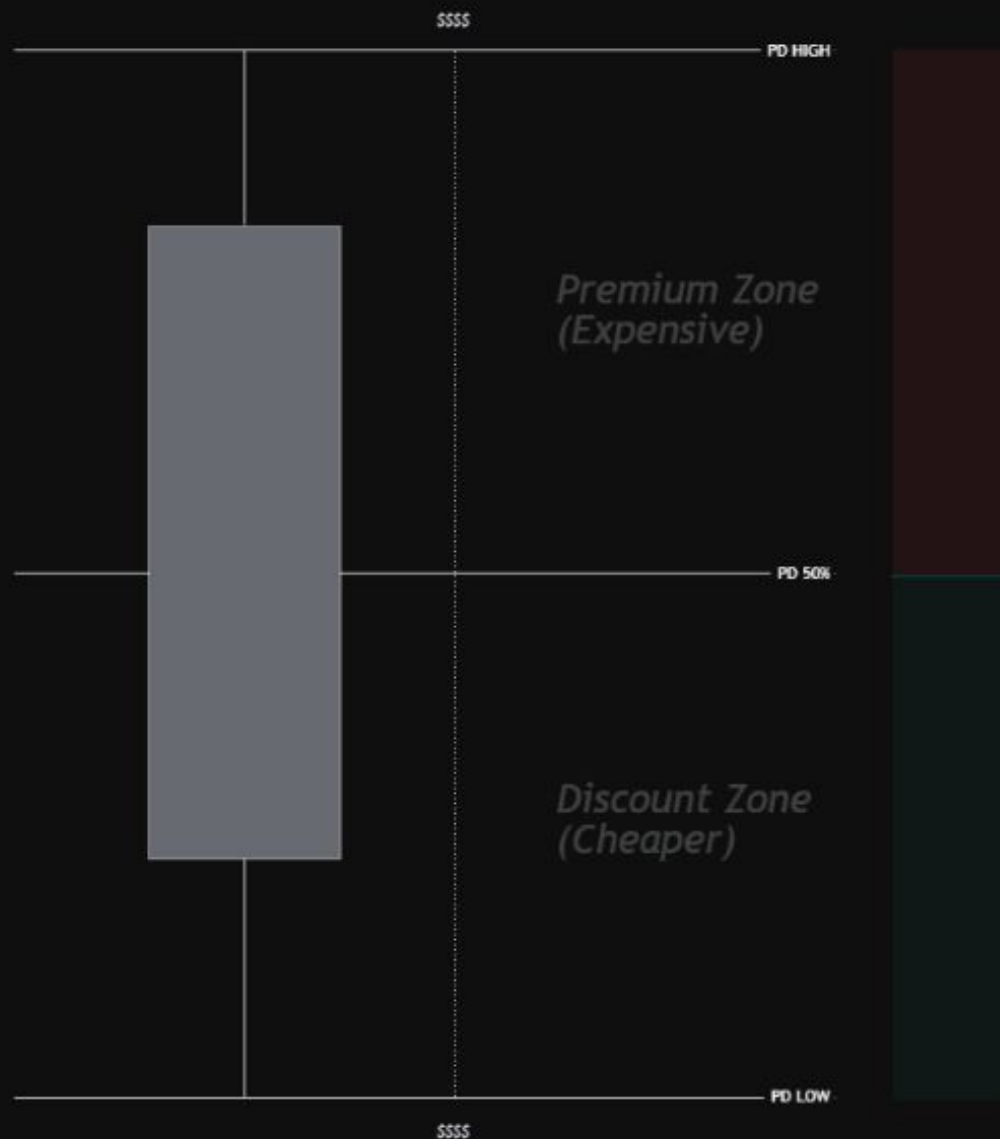

This range is part of the **accumulation** range of the day, during which lot of orders have been placed during this time, making the high and the low of this range an important liquidity pool zone.

THE ICT MIDNIGHT OPEN VERTICAL LINE 00:00

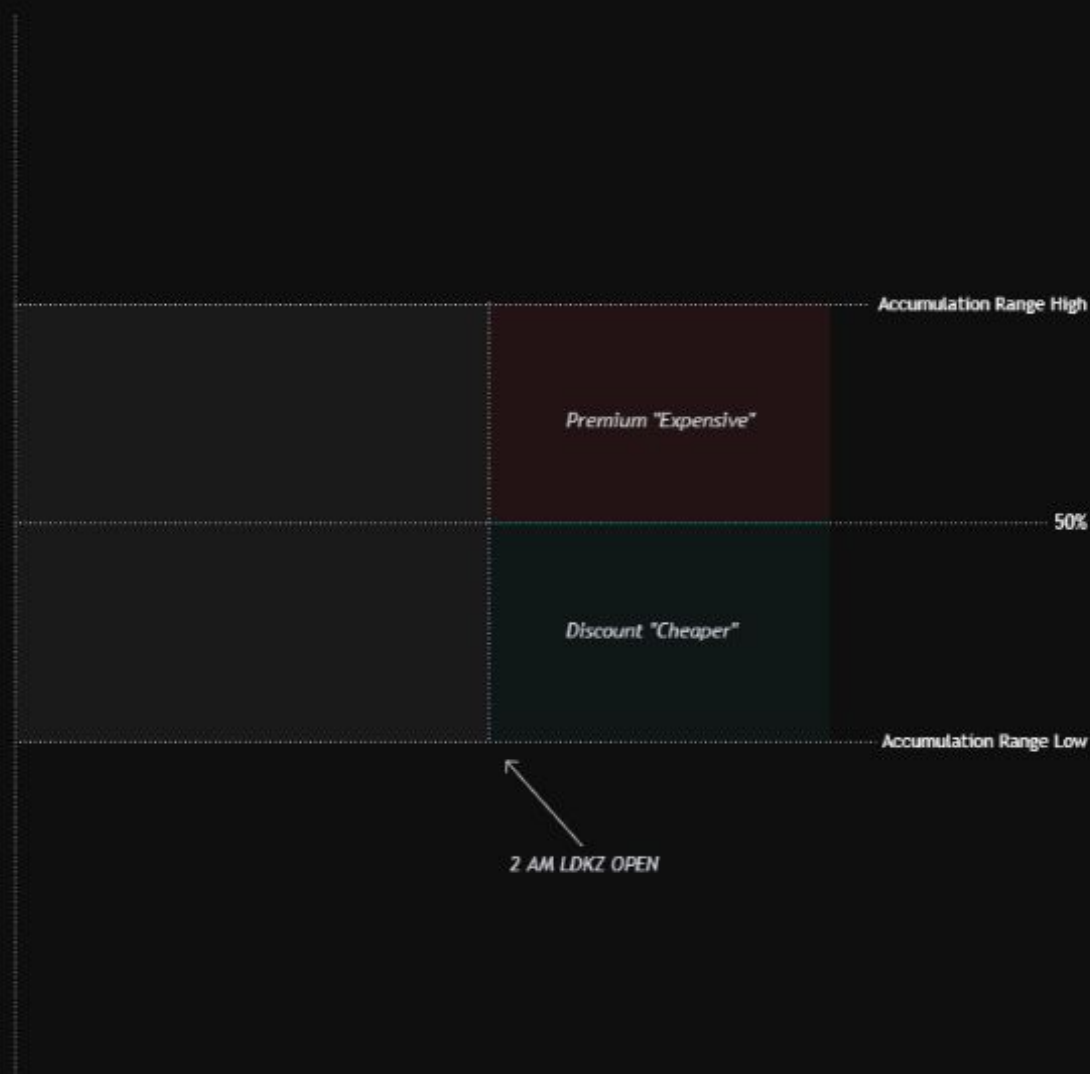

The midnight open **00:00** refers to the opening price of a financial instrument at midnight New York time. This opening price is significant as it represents the True Day Open, which is when the Algorithm turns on and therefore an important reference point.. the price decline below the midnight opening price ADD to look for an buy opportunity, for example.

You can extend the 00:00 Open to the actual price if you want.

PREVIOUS DAY RANGE (HIGH-LOW + 50%)

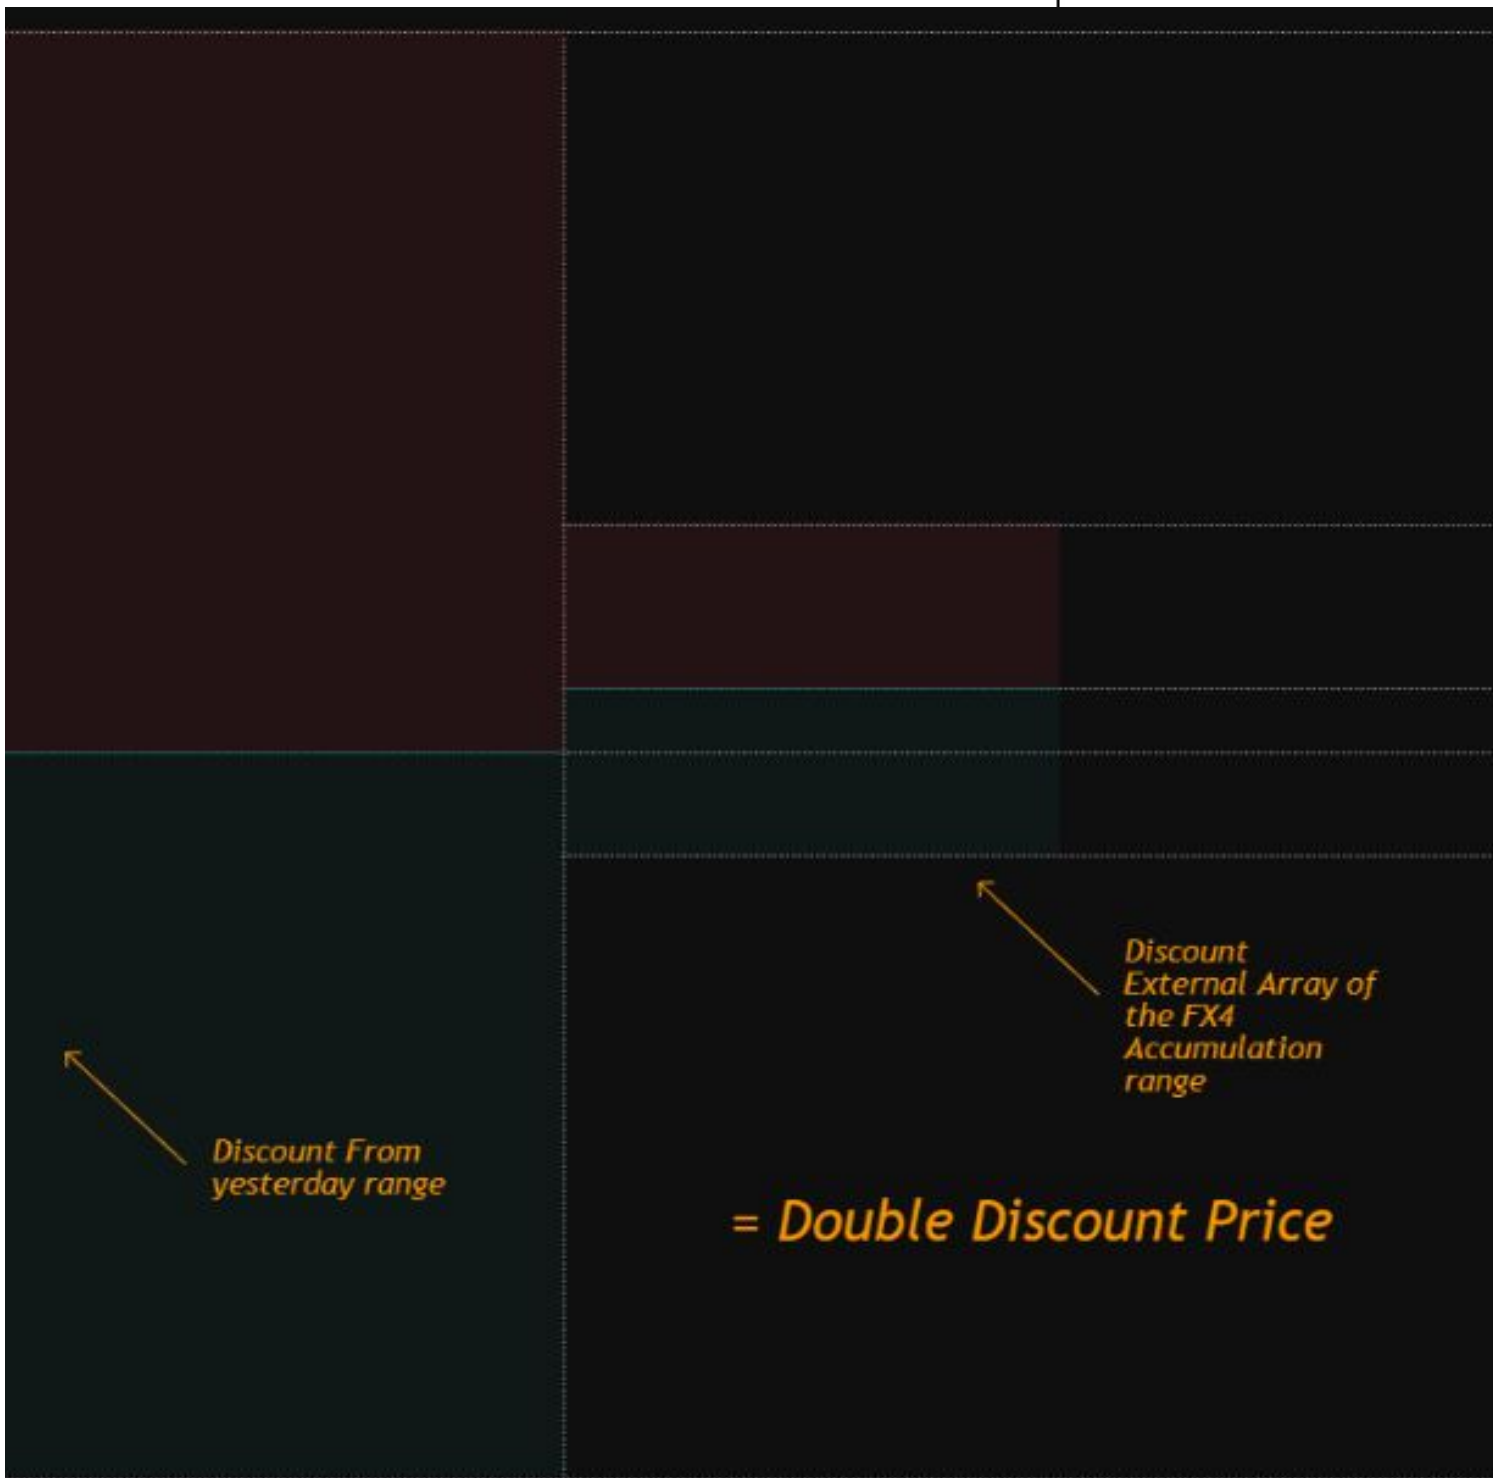

Utilizing the previous day's high and low **PD arrays** in your trading strategy for the current day, you can employ them as reference points for potential trading opportunities. (buy side and sell side liquidity) the 50% divides the previous day into a premium and discount zones. Meaning if the price is in Discount, you are looking for a buy, and if the price is in premium you are looking for a sell.

FX4 ACCUMULATION RANGE (HIGH-LOW + 50%)

Utilizing the accumulation range high and low as most recent liquidity zone of the current day, you can employ them as reference points for potential trading opportunities (buy side and sell side liquidity). The 50% divides the accumulation range into a premium and discount zones.

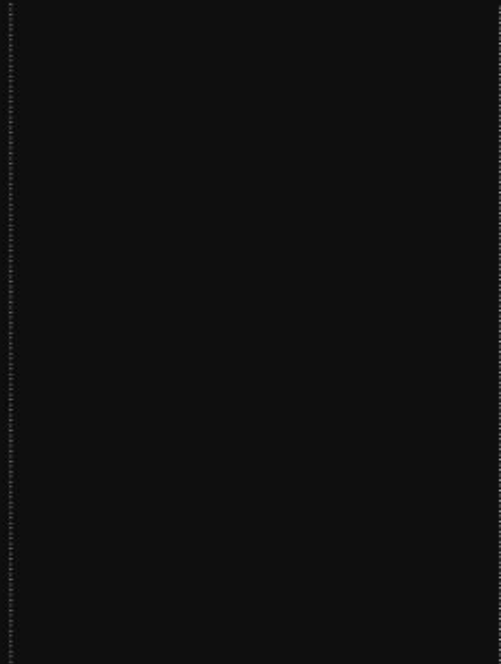

Meaning if the price is in Discount, you looking for a buy and then if the price is in premium you looking for a sell.

Double Discount/Premium Zones

The previous daily range into a premium and discount zones.
The accumulation range into a premium and discount zones.

Meaning if the price stop hunt the accumulation range high or low in both Discount zones, you are looking for a buy and then if the price is in both Premium zones you are looking for a sell.

2:00 AM NY

3:00 AM NY

KILL ZONE TO USE :

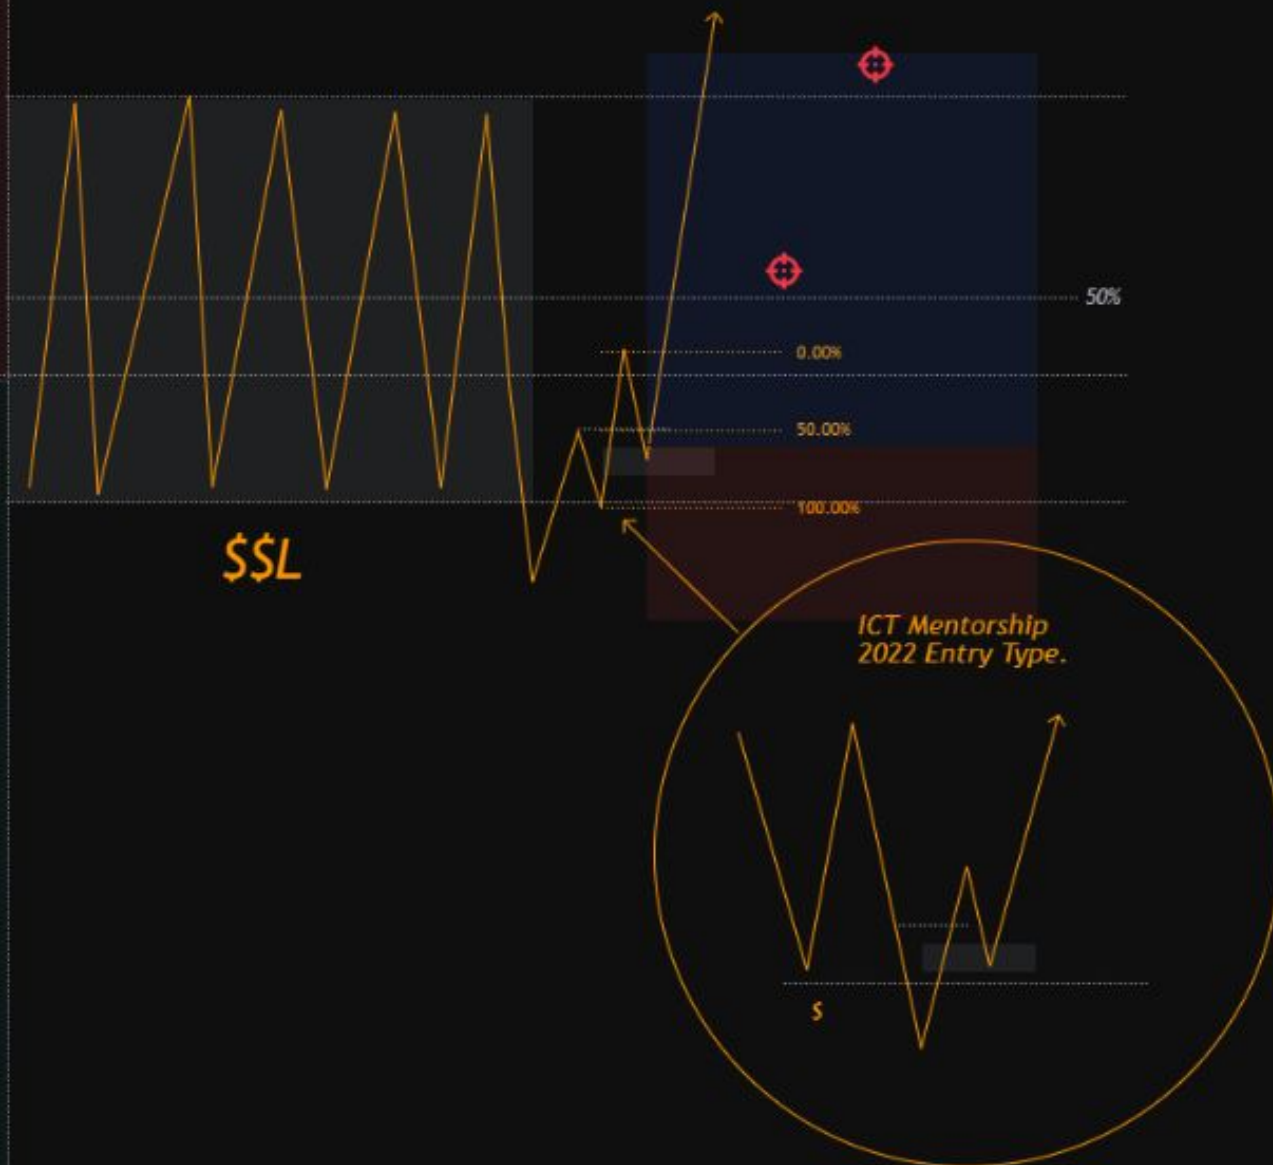

You are looking to enter after a stop hunt between 2 am and 3 am has taken place. If you are in a position, you want to be out of the trade before 5 am NY local time.

(New H4 open) so possible retracement into your position.

Note: this stop hunt most often becomes a new high or low of the current day.
