# Background

- My initial aim was to gather insight on how market makers sell/buy models forms, and how to utilize from that in my trading
- After I shared this study on Telegram, KofiRamsey shared [his studies](#)

# What is MMXM?

- MMXM is an acronym for Market Maker X Model, where the X denotes S or B (Sell or Buy)
  - MMSM describes a sell model
  - MMBM describes a buy model
- Consolidation initiates MMXM
- Look back, to the left on your chart for a reading on where we are

## Warning

- Most of you will not understand this study at first, acknowledge that
- It will require a lot of time to backtest & understand
- **Time & practice is key** 
- Trading is a game of probabilities

# Background

- MMXM are models from ICT teachings
- What is MMXM?
- How to spot MMXM?
- Examples

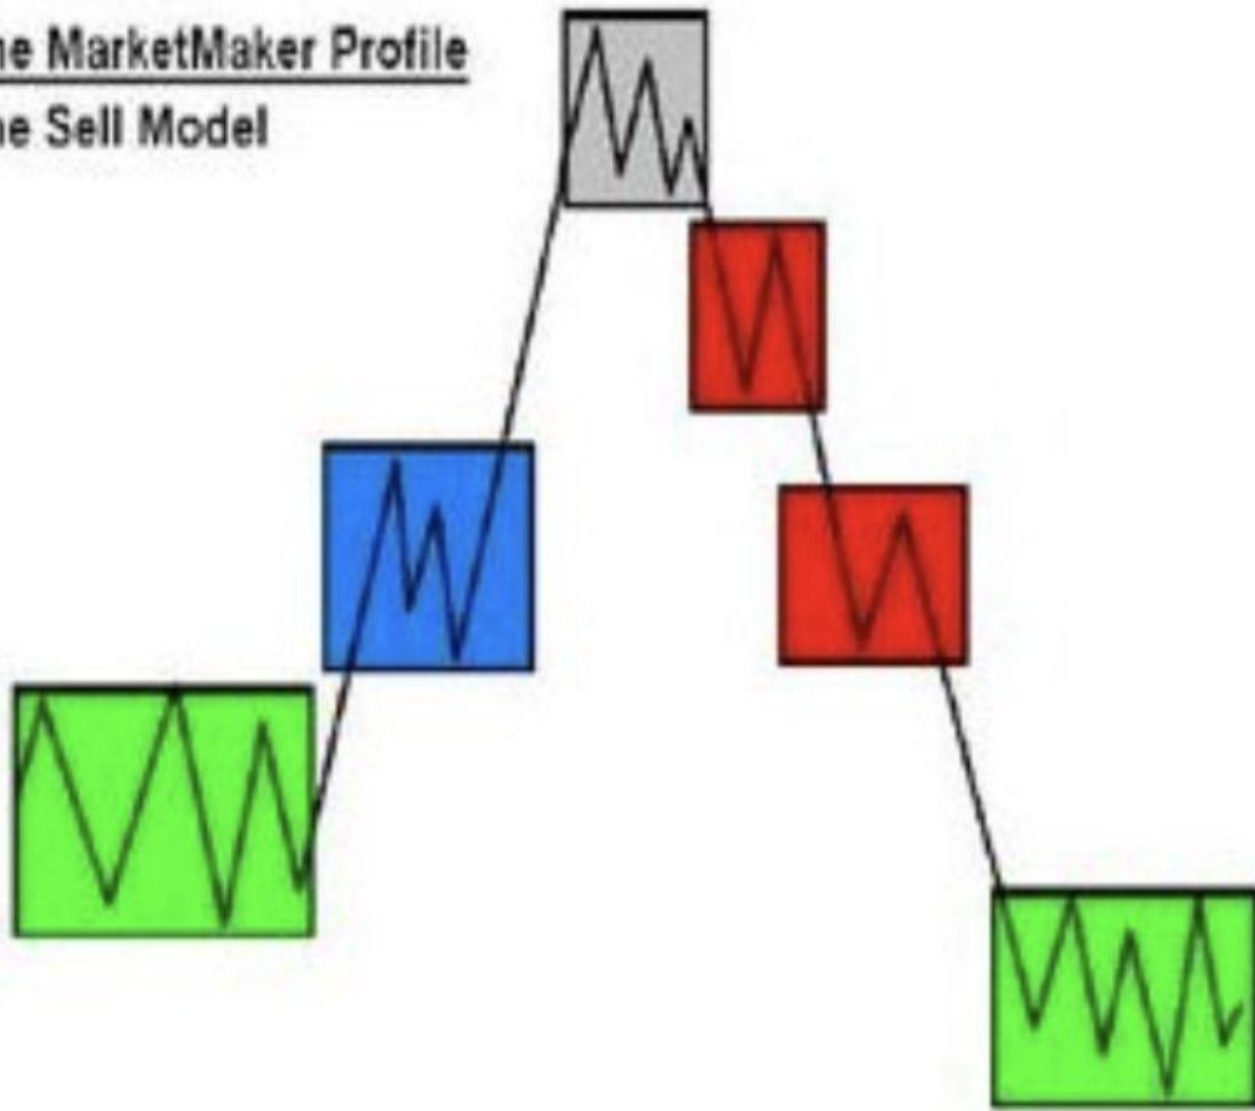

# Fractals

- MMXM are fractal patterns with fractals repeating inside, on all timeframes
- There are four types of fractals:
  - MMSM
  - MMBM
  - MMSM OTE
  - MMBM OTE
- **All of these fractals are used to make one of the larger ones**
- **PA will blend model to model**
- **All the models will use OHLC levels of Monthly/Weekly/Daily**
- MWD-levels are most significant for the algo
- Monthly: Lookback OHLC last 3 months
- Weekly: Lookback OHLC last 3 weeks

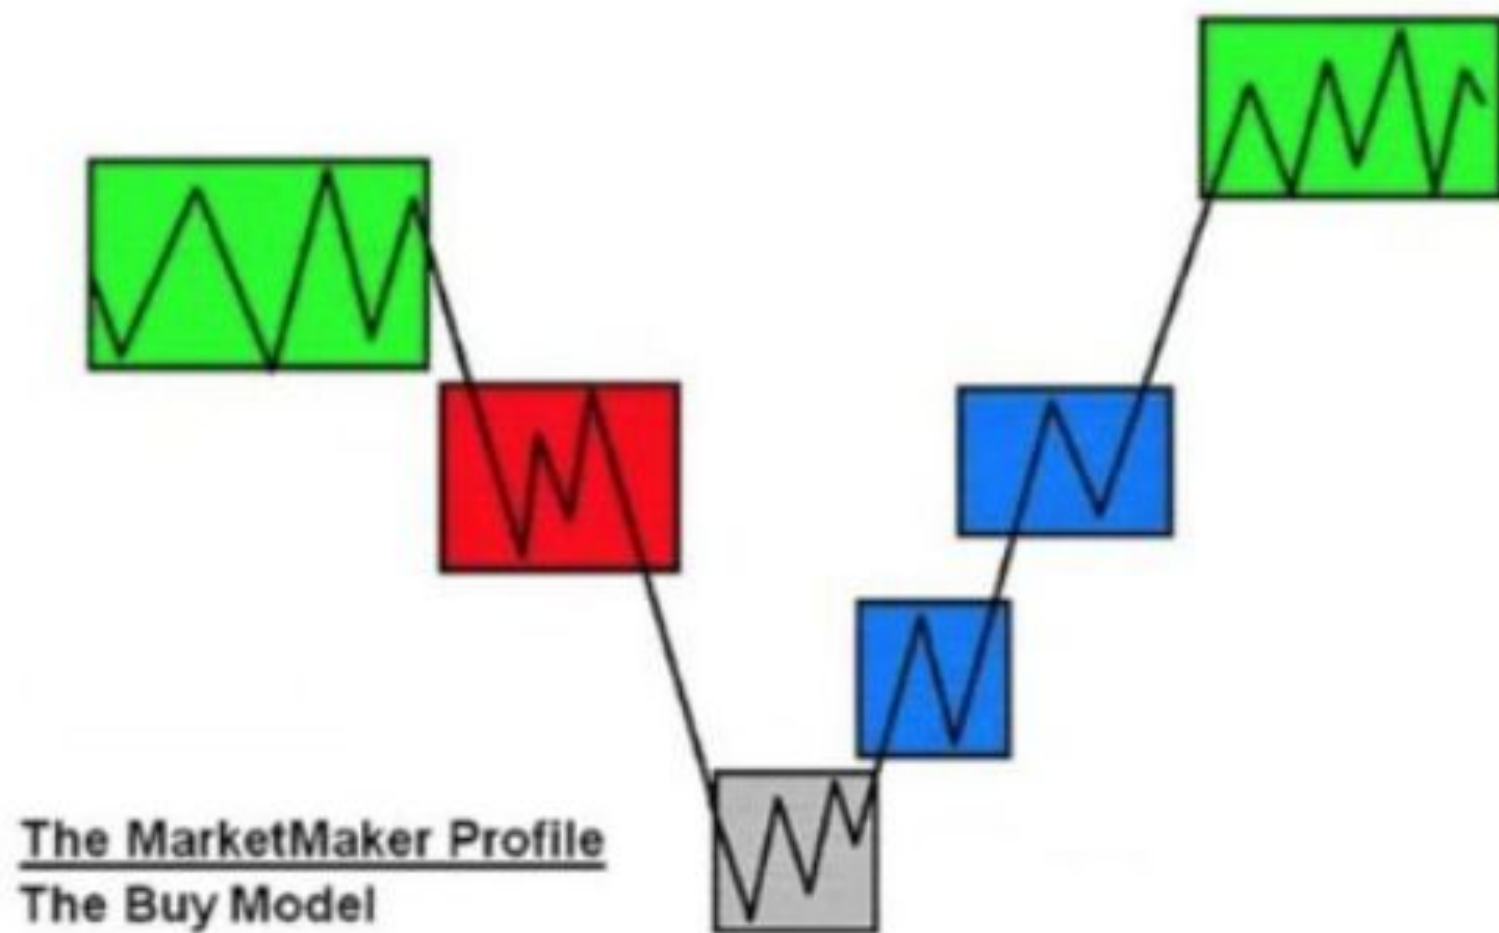

# Fractals (cont)

- All the models will use MWD OHLC levels for turning points and accumulate in consolidations to start models
- Whatever month you're in, look at the last 3 months OHLC
- For the week, look at last 3 weeks OHLC
- For the days last 3 days OHLC
- Study those levels going forward or backtesting, and you'll start to see how the models use them with time for the candle
- You'll be able to see significant highs/lows of daily, weekly, monthly candles at the turning points of those 4 fractals

The MarketMaker Profile  
The Sell Model

# ICT Study Guide

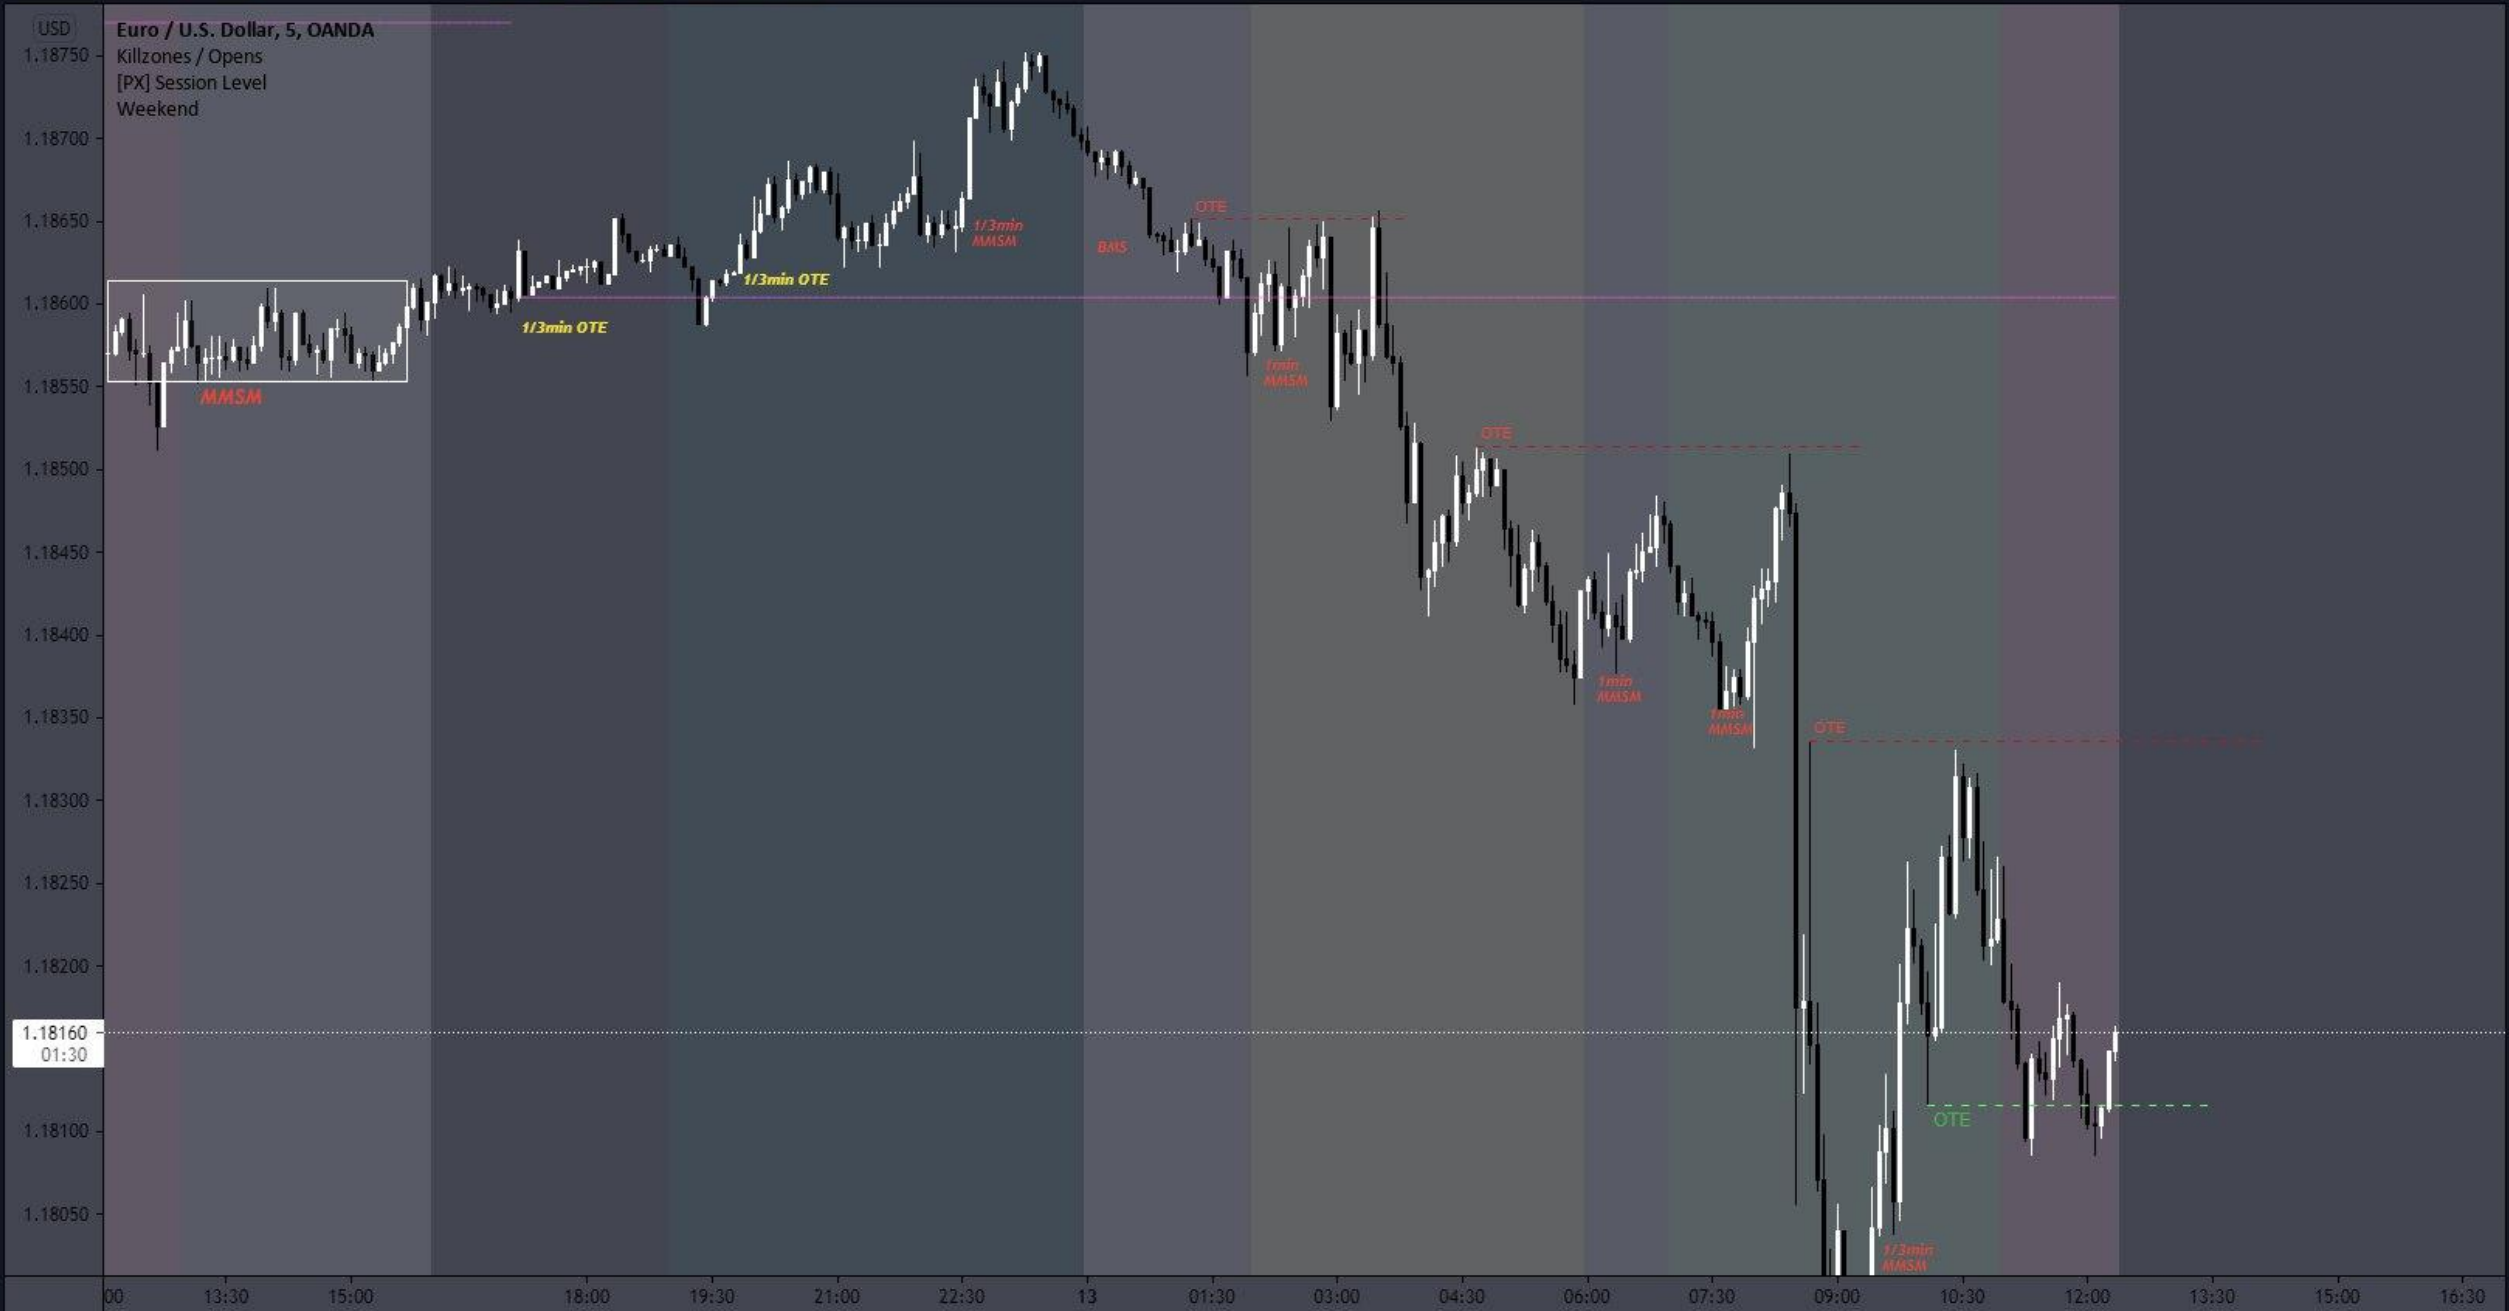

- Charter Model 6&7
- Month 4 RCB video
- Month 8
- MM Series on YT

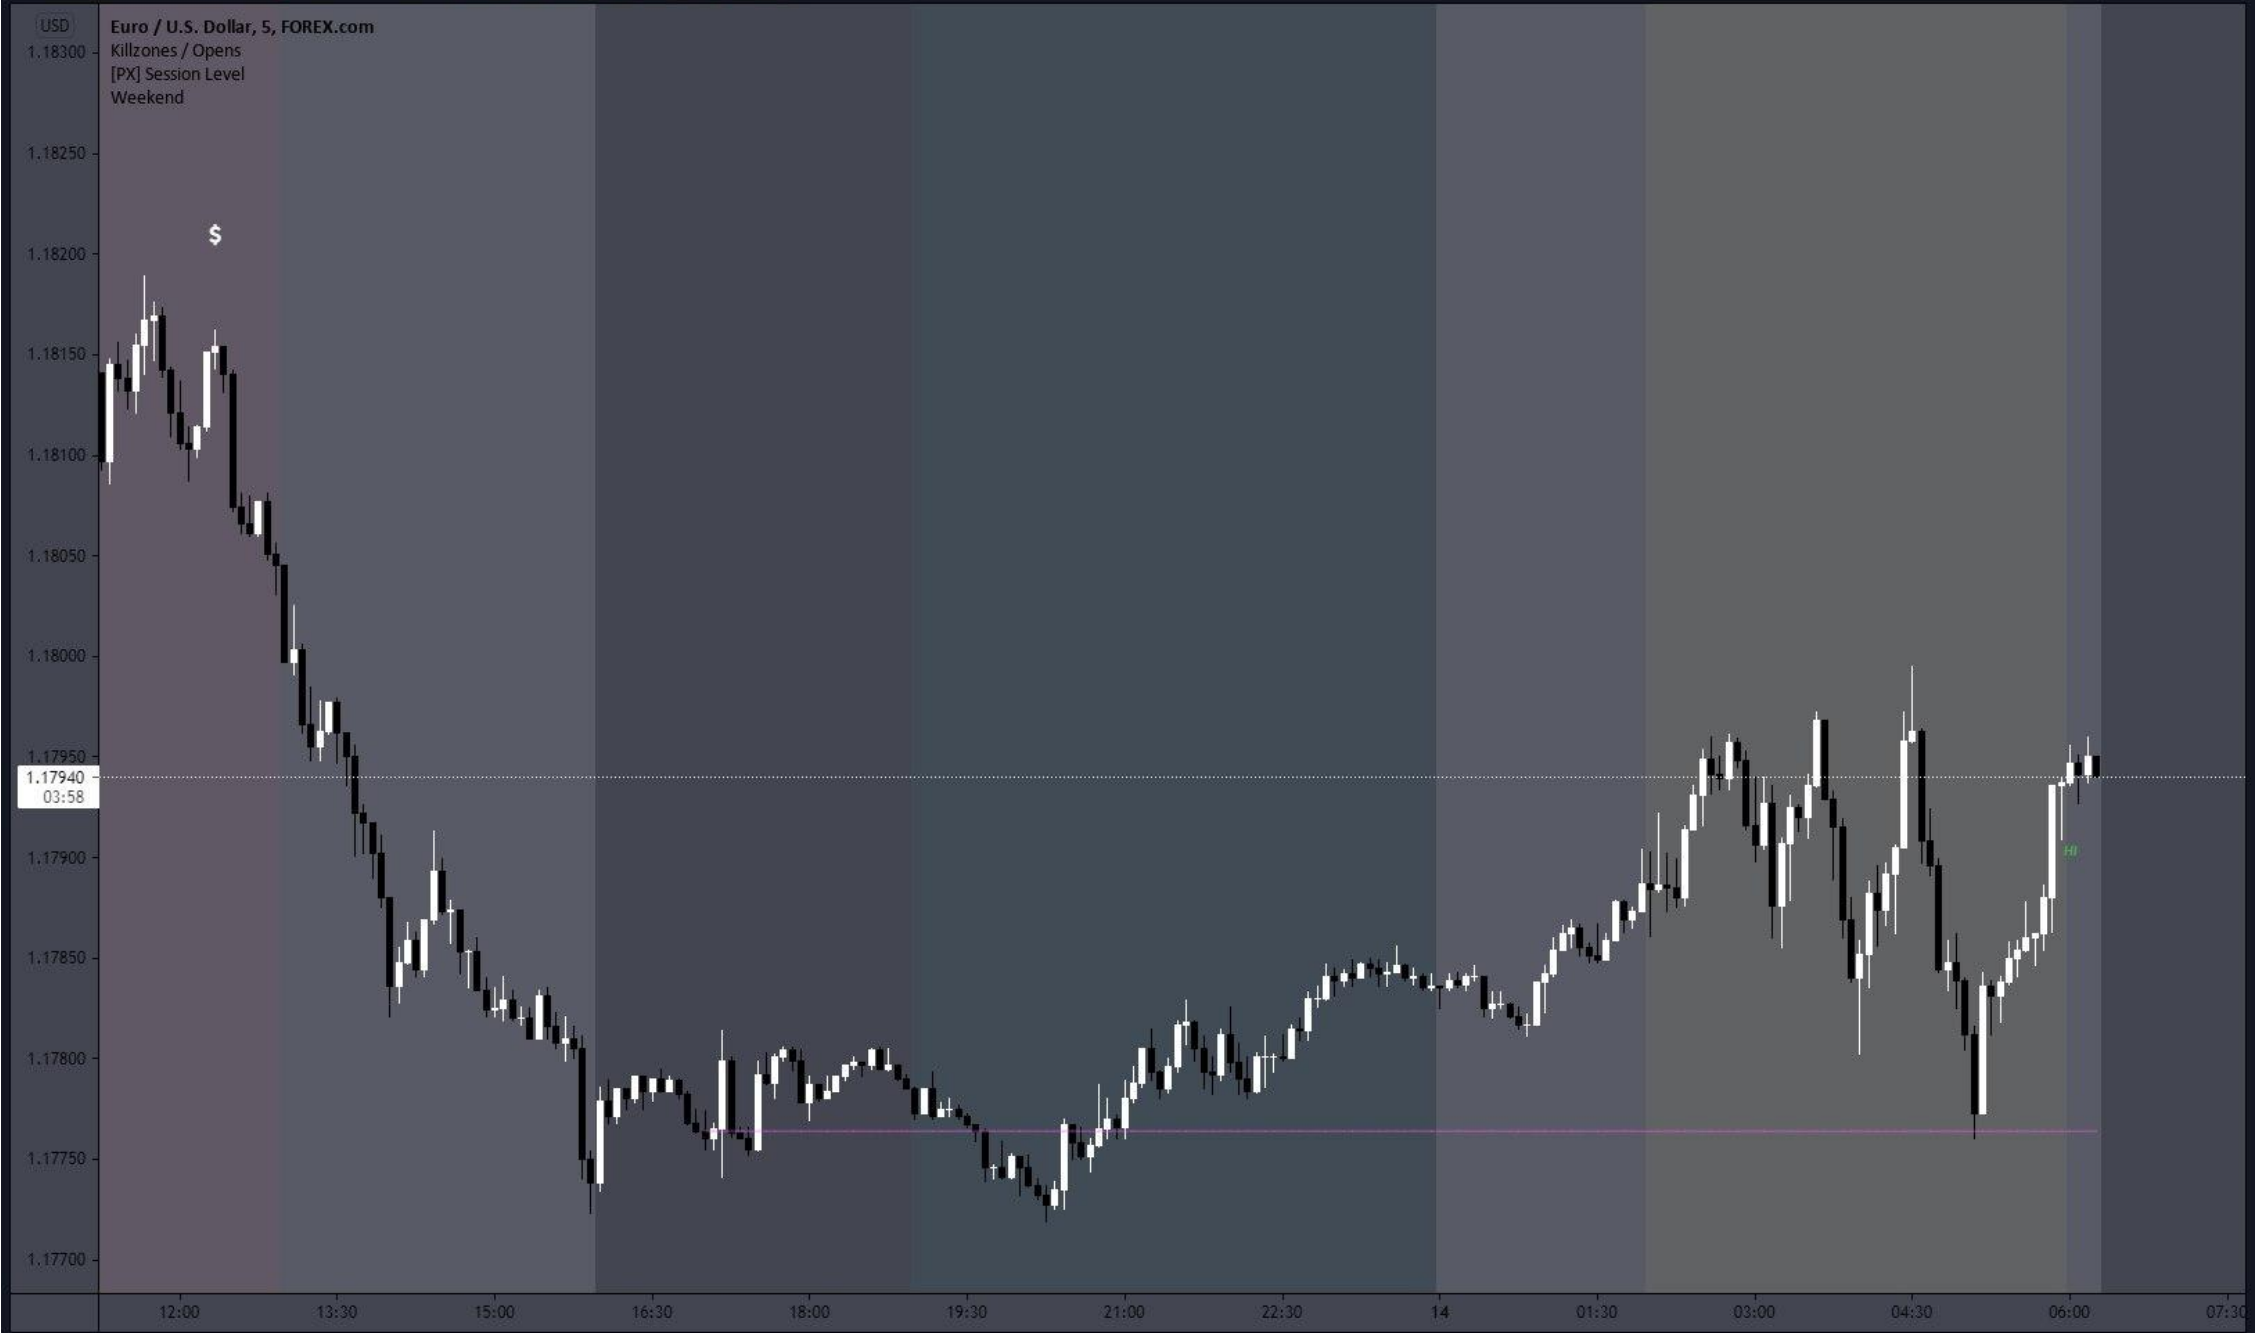

- Look for MMSM in bearish env
- Look for MMBM in bullish env
- Wait for price to react counter trend at key level (failure to breach it)
- Wait for smart reversal (SMR)
- Enter at the low risk sell/buy
- Look for levels that fails to be taken and then hunt for a MMSM/MMBM, like previous day low/high – or any other PDA

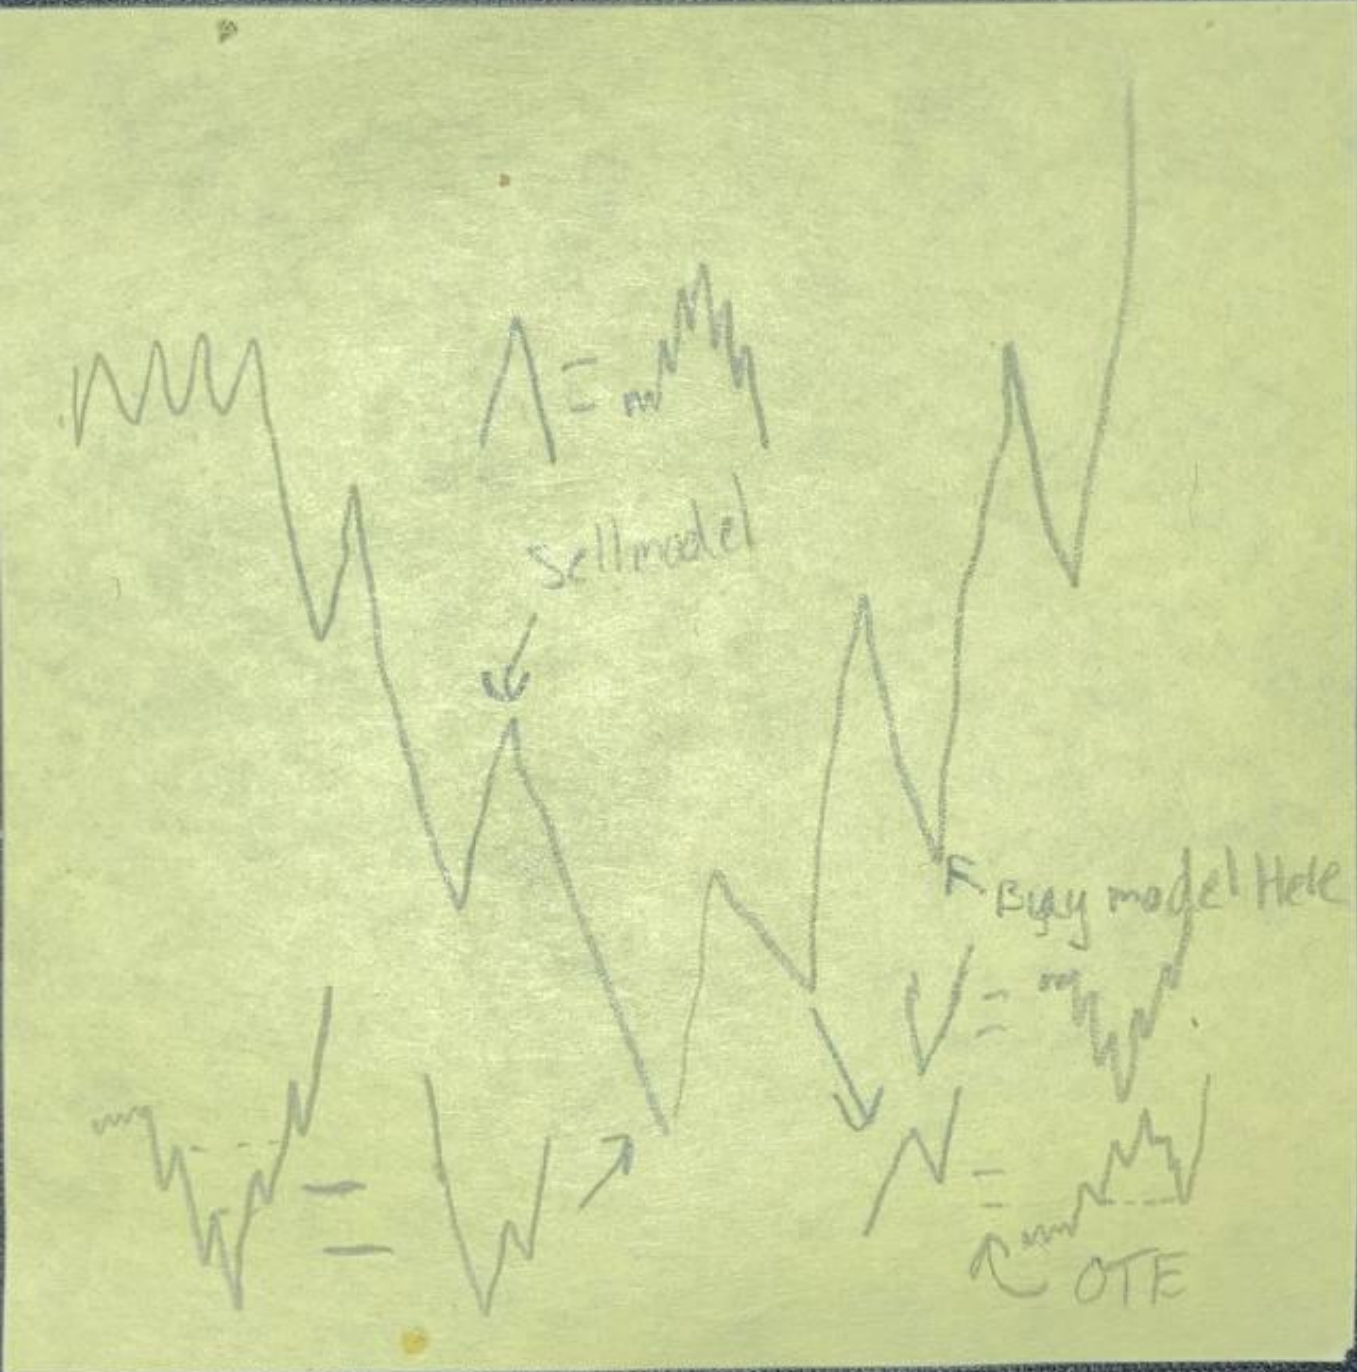

MMSM in the original consolidation box. Then you get the BMS. Then that consolidation/OTE in LO starts your next model. Then exactly how you have your boxes on the sellside is where both OTE's are in NY. But in the second OTE in NY there is a little consolidation that starts the MMBM for the 3rd leg down in the overall model.

Source: RaeFx

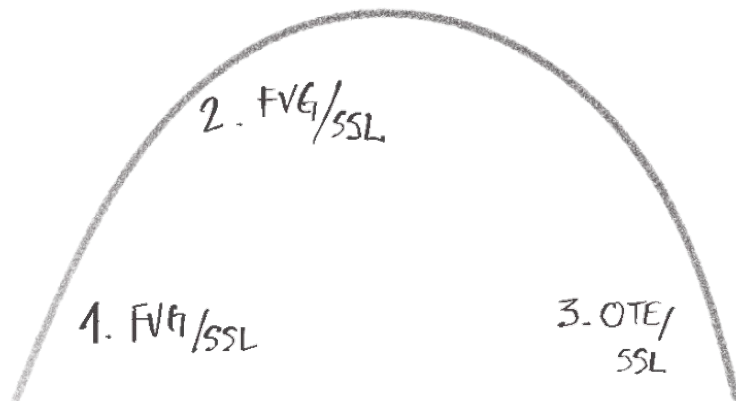

## Buying areas MM SM:

sell side

Buy side

Each box in  
the sell model  
should match  
an opposing  
box on the  
buy side

HTF Level      1, 2, 3

Weekly      =      D / 4H

Daily      =      4H / 1H

4H      =      1H / 15m

1H      =      15m / 5m

BMS in Asia. Starts consolidation. 1,2,3 but the whole 3rd leg up is a MMSM on Itf. Then drops to OTE/Original consolidation.

LO comes in.

BMS in the MMSM in that third leg up. Starts consolidation for MMBN where the crossair is then 1, 2, “consolidation” on midnight open (green line) then MMBM for the 3rd leg down in the overall model.

HTF.

We talked about the MMBM. But yesterday I mention previous days NY high would be targeted and we would have to see.

That's because it was the OTE lvl in the MMBM. Now we have the consolidation in LO from yesterday and possibly a MMSM (Could OTE too)

Plus DXY took that OTE lvl/NY low so SMT going on.

## How to spot

- Study swing highs and lows on lower time frames
  - Like daily 3 bars on a 1hr/30min or
  - 1hr/4hr 3 bar swings on like 15/5 min.
- And just look for the MM models that made the market turn.
- Then when you see a MM model, break it down in LTF and find the smaller models inside the larger one.
- Or if you think one is forming... find the smaller models inside the larger one you think is forming to confirm it's really forming.

Do the 3 bar study and just look for models.. and when you find an MMBM/MMSM just the ones inside of it that form it. That's the best way to back test when your still learning in my opinion. And just going in everyday/every week practicing with live data and at the end of the day/week break the PA down through all timeframe and find the MM models that formed inside that daily and weekly range.

TradingView

Every green dot could be an entry. Of course you would cherry-pick, but still.  
If you know the lows will likely go and you're in a MMSM- It should be a low risk sell.

# EU / DXY

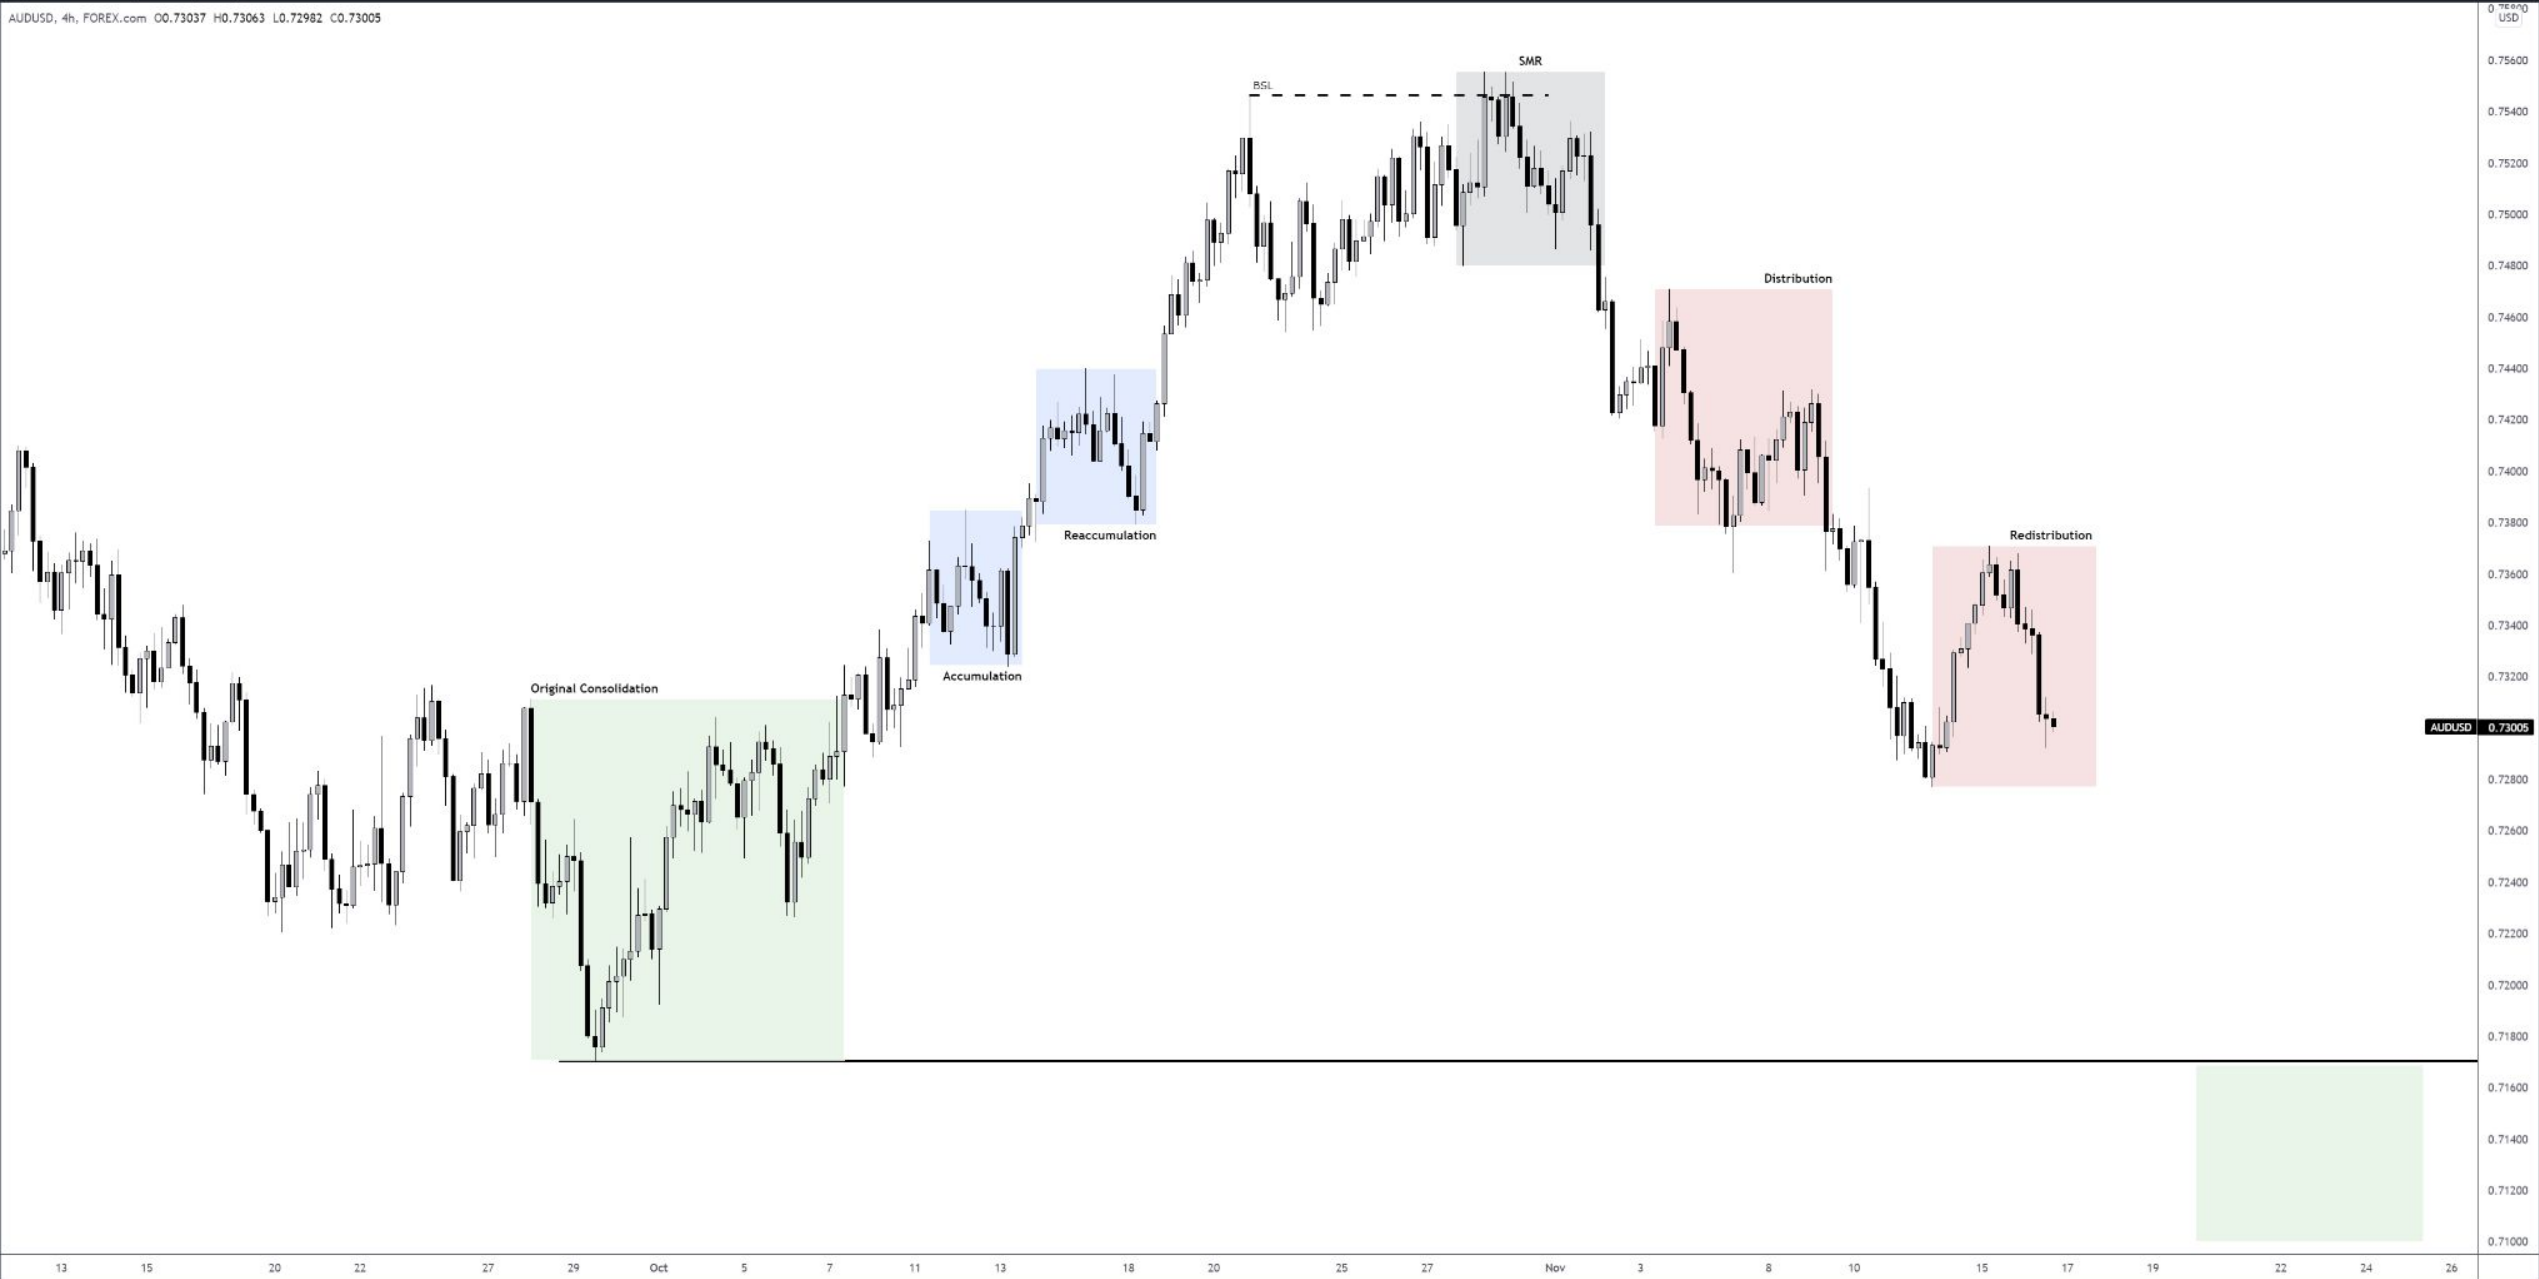

- EU or DXY is going to open up on one of those OHLC levels.
- MWD 12 am
- When one of them does that, say EU opens on a PWL, but DXY doesn't open on that same level - **that is significant**
- That level will cause DXY to draw to it and significant things will happen in PA depending on the narrative, it's gonna be a reversal there forming a high/low for the range, or it's gonna be an OTE at that level near that and it will show the level EU will seek
- Highs/lows are set at the open
- Just knowing the levels of the MWD OHLC + time

...

🔒 Timing and fractals are consistent. Spot the timing, and you won't need charts.

**6IXTH7ENSE** @6IXTH7ENSE · Oct 26

Do the Fractals, patterns, models really work? Can you get consistency using just them?

I don't think so, I do think you need to know directional bias, underlaying narrative and context of your trades before you look up at Fractals.

+Time is essentially most important factor.

Spotting MMXMs

- Catching tops or bottoms is like catching falling knives. You might be lucky or you'll bleed
- This study will research how to spot reversals and when to get a good entry in terms of RR

# Reclaimed blocks

- ICT teaches in Month 4, lesson 3.4 about reclaimed blocks
- Reclaimed blocks can be used to confirm buy/sell-side of the curve
