

MMXM + ORG Repricing Model

MMXM + ORG REPRICING

WHY MMXM?

The Market Maker Model is understanding that price is repricing higher into a HTF Premium Array to go down (MMSM) or repricing lower into a HTF Discount array to move up (MMBM) and it happens every day.

This model leaves footprints, we can use them to take high probability setups.

WHY ORG REPRICING?

The Opening Range Gap is the range between the Close of the previous day and the Open at 9:30am using Regular Trading Hours (RTH).

An ORG is a real liquidity void and can act as a strong magnet for price when is in line with the bias and as a Soft Bias when we don't have a hard bias for the day.

ORG Sensitive Levels:

1. Close
2. Open
3. Consequent Encroachment (C.E.)

- The ORG is not a standalone concept, it needs to be used in line with narrative.

GENERAL MMXM MODEL

This is a basic layout of the Market Maker Buy Model, I'm going to use it to explain the whole model but it can be equally applied to a Market Maker Sell Model.

MMXM + ORG Repricing Model

With Hard Bias

Bullish Bias:

If we're bullish and after the 9:30am Open we have reached a HTF Discount Array and we have an unfilled ORG above market, this is a high probability condition for the market to find continuation higher to fill the ORG and then using it as support to continue moving higher.

Here we can take partials at the Original consolidation and leave a runner until we reach an opposing premium Array.

MMXM + ORG Repricing Model

Neutral Conditions

Neutral/ Consolidation

If we don't have a hard bias for the day and after the 9:30am Open we have reached a HTF Discount Array and we have an unfilled ORG above market, the ORG will act as a soft bias and we can use the HTF PDA to frame a long.

The ORG doesn't need to be filled, price can go into an intermediate term PD Array and then reverse. I usually focus on moving from discount to premium of the current dealing range.

MMXM + ORG Repricing Model

Against Bias

Bearish Bias:

If we're bearish and after the 9:30am Open we reach a HTF Discount Array and the ORG is above market, the market might reprice higher to fill the ORG or at least tap the low before continuation lower.

You want to have an Intermediate Term PD Array as a draw as well, like an FVG the market was repricing to before resuming lower. In this condition be nimble, take profits quick.

MODEL ESPECIFICS

Using the logic of a Market Maker Buy Model:

1. Draw on liquidity: Opening Range Gap + H1/M15 PD Array
2. Reacting off HTF PD Array: H4/D1/W1 PD Array with nested H1/M15 PD Array.
3. On the left side of the MMXM, I want to see price engineering Trend-line liquidity or Relative Equal Highs/Lows.
4. SMT Divergence with a correlated market is ideal, specially against bias and neutral conditions.
5. The entry needs to happen inside a 20 minute Macro.
6. Use your preferred entry model: In M1 to M5, turtle soup, IFVG, breaker, etc.

- In my HIGHLIGHTS you can find threads with case studies of this model and threads going into detail on MMXM.
