

DR. RAJ MMXM

TIME & PRICE MMXM

A COMPLETE GUIDE

Let's get started

Introduction

Dear Reader,

Welcome to this exclusive eBook, where we invite you to embark on a journey toward a deeper understanding of Algorithmic Price Delivery. This guide is crafted for those eager to elevate their trading skills and gain insight into the intricate mechanisms that operate within financial markets every day.

As emphasized by The Inner Circle Trader (ICT), Michael J. Huddleston, understanding Market Maker Models (MMXM) is essential for any serious trader. Ignorance of these models can hinder your grasp of market dynamics and ultimately your trading success.

This advanced PDF aims to significantly enhance your understanding of Algorithmic Price Delivery. By the end of this book, you will not only grasp the concepts discussed.

So, buckle up, grab your notepads, and prepare to unlock the potential of your trading journey!

Phases of Market Maker Models (MMXM)

1. Accumulation

- **Definition:** This is the initial phase where market makers quietly accumulate positions, often at lower prices.

- **Purpose:** Market makers create a sense of stability or a perceived trend to attract retail traders, leading them to believe that the market is moving in a specific direction.
- **Strategy:** By generating false price movements, they entice retail traders to enter positions, often against the market maker's own intentions.

2. Distribution

- **Definition:** Following accumulation, this phase occurs when market makers begin to sell off their accumulated assets at higher prices.
- **Objective:** Market makers capitalize on the increased demand and higher prices generated during the accumulation phase.
- **Mechanics:** As retail traders buy into the perceived upward trend, market makers offload their positions, profiting from the price increase.

Insights and Implications

- **Understanding Phases:** Recognizing these phases helps traders anticipate market movements and avoid being misled by apparent trends.
- **Strategic Positioning:** By understanding how market makers operate, traders can make more informed decisions and align their strategies with the underlying market dynamics.

Next Steps

- **Deep Dive:** Moving forward, we will explore each phase of the MMXM in detail, equipping you with knowledge to enhance your trading skills and understanding of market behaviour.

Market Maker Sell Model (MMSM)

The Market Maker Sell Model (MMSM) provides a framework for understanding price movements in financial markets through its distinct buyside and sellside components.

Structure of the MMSM

- **Buyside:** The buyside of the curve draws higher, targeting buyside liquidity above previous highs. This upward movement is often driven by market makers to attract buyers and accumulate positions.
- **Sellside:** In contrast, the sellside of the curve draws lower, seeking sellside liquidity positioned beneath old lows. This downward pull is engineered to trigger stop-loss orders from long positions, creating opportunities for market makers.

Phases of the MMSM

1. **Initial Consolidation:** The MMSM begins with a consolidation phase where relatively equal lows are formed. Retail traders

often interpret these equal lows as strong support, leading them to place stop-loss orders just below.

2. **Psychology of Retail Traders:** When the market fails to break lower, retail traders view this as a bullish sign. Their stop-loss orders become sellside liquidity that market makers can exploit.
3. **Market Expansion and Retracements:** The market then expands upwards, often experiencing 1-3 retracements on the left side of the curve. Each upward leg attracts more buying interest, further accumulating positions.
4. **Transition from Buy to Sell Program:** Eventually, the market reaches a critical level where it shifts from a buy program to a sell program. This transition occurs because the buyers, who have profited during the upward movement, now have their stop-loss orders positioned below the recent lows.
5. **Smart Money Reversal:** As the market changes from buying to selling, the sellside liquidity—comprised of the triggered stop-losses—becomes the target. This marks the Smart Money Reversal, where the market begins to roll over.
6. **Sellside Dynamics:** Once the market shifts, it will typically see 1-3 expansions followed by retracements, all leading towards the original consolidation low. The ultimate goal is to reach and trade below this consolidation, completing the MMSM.

Conclusion

Understanding the MMSM helps traders recognize key market dynamics and anticipate potential price movements. By being aware of the buy and sell phases and the psychology behind retail trading behaviour, you can position yourself more effectively within the market. Next, we'll explore the best entry patterns that can emerge from this model.

Market Maker Buy Model (MMBM) Notes

1. Concept Overview

- Opposite of MMSM: Focuses on market maker behaviour and buyside liquidity.
- Objective: Understand how market makers manipulate price action to create liquidity.

2. Market Structure

- Initial Phase:
 - Consolidation: Price stabilizes before significant movement.
 - Equal Highs: Formation of relatively equal highs misleads retail traders into thinking a strong resistance level is present.

3. Sell Program Dynamics

- Price Drop: Sudden decline confirms resistance for retail traders, prompting short positions.
- Stop Loss Placement: Retail traders place stop losses above equal highs, creating engineered buyside liquidity.

4. Transition to Buy Program

- **Key Level Reached:** At the right moment, the market transitions from sell to buy.
- **Sellers' Profit:** Sellers have profited during the downtrend, leading to the shift in market dynamics.
- **Liquidity Seeking:** The market targets buyside liquidity above the old highs.

5. Structure of MMBM

- **Sellside Curve:**
 - **1-3 Expansions:** Characterized by downward movements followed by retracements.
- **Buyside Curve:**
 - **Expansions and Retracements:** Similar structure as sellside; marked by upward movements and pullbacks.

- **Fractal Nature:** The left side (sellside) influences how the right side (buyside) unfolds.

6. Model Completion

- **Final Indicator:** The MMBM is complete when price trades above the original consolidation level, signalling a successful shift to a buy program.

7. Key Principles

- **Liquidity Engineering:** Understanding how liquidity is built and sought by market makers.
- **Market Phases:** Recognizing the phases of sell and buy programs helps in anticipating price movements.
- **Fractal Patterns:** Insights from past price behavior are crucial for predicting future movements.

This structured format should help you grasp the essential elements of the MMBM more effectively!

Smart Money Reversal (SMR) Notes

1. Concept Overview

- **Definition:** The SMR occurs at key price levels during specific time windows, indicating potential reversals driven by smart money.
- **Importance:** Recognizing these reversals helps traders align with market movements.

2. Time and Price Alignment

- **Key Principle:** Significant market movements happen when there's alignment between time and price, often referred to as "Time and Price alignment."
- **Focus Areas:**

- **Key Price Levels: Identifying Time Based Liquidity Pools and Higher Timeframe PD Arrays (e.g., HTF Imbalances).**

3. Time Based Liquidity Pools

- **Understanding: These pools are linked to specific times when liquidity is expected to be present.**
- **Application of Time Cycles:**
 - **Killzones: Specific time frames during which liquidity pools can be anticipated.**
 - **Asia Session: Generally ignored for liquidity.**
 - **London Session: Focus on Asia's High and Low.**
 - **New York Morning: Consider both London and Asia's High and Low.**
 - **New York Afternoon: Focus on Morning's High and Low.**

4. Fractal Time Cycles

- **Concept: Time cycles can be broken down into smaller cycles, providing opportunities for more granular analysis.**

5. Liquidity Purging

- **Mechanism: When price crosses the High or Low of a previous time cycle that opposes the current narrative, look for confirmations (signatures) indicating potential liquidity purging.**
- **Objective: Draw towards the opposing liquidity pool.**

6. Bearish Example

- **Scenario: During the New York session, anticipating lower prices.**
 - **Observation: Price trades above the London High.**
 - **Action: Look for confirmation signatures indicating a potential SMR.**
 - **Target: Anticipate the London Low as the Draw On Liquidity.**

7. Bullish Example

- **Scenario: During the London session, anticipating higher prices.**

- **Observation:** Price trades below the Asia Low.
- **Action:** Look for confirmation signatures indicating a potential SMR.
- **Target:** Anticipate the Asia High as the Draw On Liquidity.

Key Takeaways

- The SMR is a critical concept for identifying potential market reversals based on time and price.
- Understanding the timing of liquidity pools helps traders align their strategies with market movements.
- Using killzones effectively can enhance trading decisions by providing context for potential liquidity events.

These notes capture the essence of the SMR and its practical applications in trading!

Higher Timeframe Imbalances

Notes

1. Concept Overview

- **Fair Value Gaps:** Form when the market expands in one direction, creating areas where price has not yet retraced.
- **Purpose:** The market typically seeks to retrace into these gaps before continuing in the anticipated direction.

2. Bearish Institutional Order Flow

- **Mechanism:**
 - **Expansion Lower:** The market retraces into a Bearish Fair Value Gap.
 - **Lower Timeframe Model:** This setup represents a Lower Timeframe Market Maker Sell Model.
- **Connection to Liquidity:**
 - **Fractal Time Based Liquidity Pool:** The low of the Bearish Fair Value Gap often aligns with these liquidity pools, enhancing the

validity of the retracement.

3. Bullish Institutional Order Flow

- **Mechanism:**
 - **Expansion Higher:** The market expands upward and leaves a Fair Value Gap.
 - **Retracement:** The market seeks to retrace into this Fair Value Gap before resuming the upward movement.
 - **Lower Timeframe Model:** This scenario represents a Lower Timeframe Market Maker Buy Model.

4. Confirmation of Retracement Ending

- **Intermarket Relationships:**
 - **Importance:** Pay attention to relationships between different markets (e.g., correlations) to confirm that the retracement has ended and that the market is likely to expand in the anticipated direction.

Key Takeaways

- **Understanding Gaps:** Recognizing Fair Value Gaps is crucial for anticipating price retracements and expansions.
- **Order Flow Analysis:** Differentiating between bearish and bullish order flows helps in identifying potential trading opportunities.
- **Confirmation Techniques:** Using intermarket relationships adds another layer of validation to trading decisions based on retracements and expansions.

These notes summarize the critical aspects of Higher Timeframe Imbalances and their practical implications in trading!

Intermarket Relationship Notes

1. Definition

- **Intermarket Relationship:** Analyzing the behavior of correlated or inversely correlated markets to identify deviations from expected patterns.

2. Correlated Markets

- **Examples:**
 - **Highly Correlated:** Markets like \$NQ (Nasdaq) and \$ES (S&P 500), or \$EU (Euro) and \$GU (GBP/USD) should typically move together.
 - **Expected Behavior:** They should form swing highs and swing lows simultaneously.
- **Cracks in Correlation:**
 - **Example 1:** If \$NQ makes a lower low while \$ES makes a higher low, this indicates a crack in correlation.
 - **Example 2:** If \$EU creates a higher high while \$GU makes a lower high, that's another sign of a crack.

3. Inversely Correlated Markets

- **Examples:**
 - **Inversely Correlated:** \$DXY (US Dollar Index) and \$EU should typically move in opposite directions.
- **Expected Behavior:** If \$DXY makes higher highs, \$EU should create lower lows.
- **Cracks in Correlation:**
 - **Example:** If \$DXY creates a higher high while \$EU makes a higher low, this indicates a crack in correlation.

4. Significance of Cracks in Correlation

- **SMT (Smart Money Technique):** A crack in correlation is referred to as SMT.
- **Contextual Importance:** Not every crack in correlation is significant; only those that align with the overall Narrative and Points of Interest (POI) are meaningful.

5. Framework for Analysis

- **Overall Framework:** Utilize these insights to identify key Algorithmic Signatures.
- **Next Steps:** Understanding these relationships lays the groundwork for recognizing entry patterns within the trading framework.

Key Takeaways

- **Monitor Correlations:** Keep a close watch on correlated and inversely correlated markets for potential trading signals.
- **Identify Significance:** Focus on cracks in correlation that resonate with your trading narrative and key market levels.
- **Framework Application:** Use intermarket analysis to enhance trading strategies and identify entry points.

Entry Patterns Notes

1. Introduction to Entry Patterns

- **Focus:** This section discusses entry patterns corresponding to each phase of the Market Maker Model (MMM).
- **High Probability Model:** The goal is to present the highest probability entry model for ICT traders.

2. Low Risk Buy (LRB) and Low Risk Sell (LRS)

- **Definition:**
 - **Low Risk Buy:** The first entry within a Market Maker Buy Model (MMBM).
 - **Low Risk Sell:** The first entry within a Market Maker Sell Model (MMSM).
- **Confirmation:**

- Both entries are typically confirmed by the first Market Structure Shift (MSS) or a Change in the State of Delivery (CISD).
- Note: Not every LRB/LRS will have an MSS, but for simplicity, focus on those that do.

3. Understanding MSS and CISD

- Purpose: MSS or CISD indicates a switch between market programs (e.g., from buy to sell or vice versa).

4. Examples of Entry Patterns

- Low Risk Buy Example:
 - Scenario: A chart shows an institutional swing point (breaker) forming within a Higher Timeframe (HTF) Price Delivery Array (e.g., 1H BISI).
 - Confirmation: A CISD/MSS confirms the shift from a sell program to a buy program.
 - Entry Point: The entry is made inside the breaker block.
- Low Risk Sell Example:
 - Scenario: A chart on the 4H timeframe shows NQ forming a high and then displacing through an intermediate-term low.
 - Confirmation: This displacement confirms the transition into a sell program. A retracement occurs into the breaker block, with evidence of Smart Money Technique (SMT) with correlated assets (e.g., ES).
- Entry Point: The entry is made inside the breaker block.

Key Takeaways

- Entry Types: Understand the distinction between Low Risk Buys and Low Risk Sells as foundational entries in the Market Maker Models.

- **Confirmation Signals:** Pay attention to MSS and CISD as indicators of market program shifts.
- **Practical Application:** Use real market examples to identify and execute these entry patterns effectively.

1st Stage Accumulation/Distribution Notes

1. Introduction to 1st Stage Accumulation/Distribution

- **Context:** This phase represents the second entry in the Market Maker Model (MMXM), indicating the 1st stage of Accumulation in a Market Maker Buy Model (MMBM) and the 1st stage of Distribution in a Market Maker Sell Model (MMSM).

2. Characteristics of This Phase

- **Formation:** Involves the second formation of an intermediate-term high or low within its respective Market Maker Model.
- **Location:**
 - Often occurs inside an inefficiency on the left or right side of the curve.
 - May also form within a mitigation block (an old order block on the left side of the curve).

3. MMXM Tip

- **Mirroring Principle:** The right side of the curve often mirrors the left side; where old selling occurred, new buying will take place, and vice versa.

4. Examples

- Accumulation Example:

- **Chart Analysis:** On a 5-minute chart of NQ, observe the formation of a Low Risk Buy.
- **Price Action:** Price trades above an old area of selling (highlighted in a grey box) and utilizes this area, along with the Breaker Block (BISI), to hold support.
- **Key Insight:** This behavior exemplifies the concept of old selling becoming new buying, crucial for understanding MMXM.

● **Distribution Example:**

- **Chart Analysis:** On a 1-minute MMSM chart, the 1st stage of Distribution forms inside a Breaker Block, with an Inefficiency Fair Value Gap (IFVG) annotated in red. Engineering Insight:
- Note how the Breaker Block was engineered to initiate a Low Risk Sell stop hunt and was subsequently used for entry in the 1st stage of Distribution.

Key Takeaways

- **Understanding Phases:** Recognize the significance of the 1st stage of Accumulation and Distribution as integral components of the Market Maker Model.
- **Price Behavior:** Pay attention to how previous selling and buying areas influence current price action and support/resistance levels.
- **Chart Analysis:** Utilize real market examples to solidify understanding of these concepts in practice.

2nd Stage Accumulation / Distribution

(Silver Bullet) Notes

1. Introduction to the Silver Bullet

- **Definition:** The Silver Bullet refers to the 2nd stage of Accumulation/Distribution within the Market Maker Model (MMXM).

- **Characteristics:** Known for its rapid delivery towards the draw on liquidity.

2. Variability of Stages

- **Stage Flexibility:** Not every MMXM will contain two stages; some may have one, others may have three.
- **Uniqueness:** Each Market Maker Model is unique, similar to snowflakes.

3. Understanding the Silver Bullet

- **Timing:** The Silver Bullet phase is significant because price is typically very close to the draw on liquidity when it appears.
- **Magnetic Analogy:**
 - **Draw on Liquidity:** Think of it as a magnet.
 - **Price:** Analogous to a piece of magnetic metal (iron or nickel).
 - **Dynamic:** As price gets closer to the draw on liquidity, urgency increases, causing price to accelerate towards the target.

4. Identifying the Silver Bullet

- **Stop Hunt Preceding Silver Bullet:** A stop hunt often occurs just before the Silver Bullet phase.
- **Phase Context:** The phase in which the stop hunt occurs (e.g., LRB/LRS or ACC/DIS) helps indicate when the Silver Bullet is likely to form.

5. Examples of the Silver Bullet

- **Low Risk Buy Phase Example:**

- **Context:** When a stop hunt or Smart Money Technique (SMT) occurs during the Low Risk Buy phase, the second Intermediate-Term Low (ITL) formed after this will represent the Silver Bullet.

- **1st Stage of Distribution Example:**

- **Context:** A stop hunt occurring during the 1st stage of Distribution indicates that the next Intermediate-Term High (ITH) formed will be the Silver Bullet.

Key Takeaways

- **High Probability Phase:** The Silver Bullet is one of the most reliable entry points in the Market Maker Model due to its proximity to the draw on liquidity.
- **Awareness of Market Phases:** Understanding the sequence of events (stop hunts and their phases) is crucial for identifying potential Silver Bullets.
- **Chart Application:** Use the insights gained to analyze charts and identify Silver Bullet opportunities effectively.

The Best Entry Pattern: The True Unicorn

DR. RAJ

BULLISH EXAMPLE

BEARISH EXAMPLE

1. Introduction to the True Unicorn

- **Definition:** The True Unicorn is an algorithmic signature representing institutional sponsorship, observable across all fractal timeframes.
- **Significance:** Recognized as the most powerful entry signal when aligned with higher timeframe order flow.

2. Characteristics

- **Beyond Breaker Block and FVG:** While influenced by concepts from ICT, the True Unicorn incorporates additional elements for enhanced effectiveness.
- **Balanced Price Range:** The True Unicorn setup includes a balanced price range within the Breaker Block and Fair Value Gap (FVG).

3. Examples and Application

- **Chart Analysis:** The pattern can be found frequently across various charts; traders are encouraged to backtest and explore its prevalence.
- **History:** This setup has been successfully utilized for over two years by The Ones That Know community.

Macros in Market Maker Models

1. Introduction to Macros

- **Focus:** This section discusses the use of macro times within Market Maker Models, specifically the time of interest (TOI).

2. Time of Interest (TOI)

- **Definition:** The 30-minute period every hour (XX:45 - XX:15) serves two primary functions:
 - **Reversal:** Indicates a potential change in market direction.
 - **Expansion:** Indicates continuation in the same direction.

3. Reversals

- **Context:** A reversal occurs at the Smart Money Reversal (SMR) point, marking a change in the state of delivery.
- **Anticipation:** If a reversal is not confirmed ahead of a TOI, expect the upcoming TOI to produce a reversal.
 - **Example: Market Maker Buy Model:**
 - Between 12:45 PM and 1:15 PM (TOI), a Smart Money Reversal occurs, confirming the right side of the curve.
 - **Example: Market Maker Sell Model:**
 - Between 9:45 AM and 10:15 AM (TOI), a Smart Money Reversal occurs, confirming the right side of the curve.

4. Expansions

- **Context:** If a reversal is confirmed prior to a TOI, the next TOI is expected to deliver an expansion.
 - **Example: Market Maker Buy Model:**
 - If the Smart Money Reversal occurs outside of a TOI, the subsequent TOI is anticipated to show expansion on the right side of the curve.
 - **Example: Market Maker Sell Model:**
 - If the Smart Money Reversal occurs outside of a TOI, the next TOI is expected to reflect expansion on the right side of the curve.

○

Key Takeaways

- **True Unicorn Pattern:** Recognized as the most powerful entry setup, integrating key elements that signify institutional activity.
- **Macro Timing:** Understanding TOIs is crucial for anticipating market behavior, with specific focus on reversals and expansions to inform trading decisions.

Important Macros

London Session

- Time of Interest (TOI):
 - 2:45 AM - 3:15 AM
 - 3:45 AM - 4:15 AM

New York AM Session

- Time of Interest (TOI):
 - 9:45 AM - 10:15 AM
 - 10:45 AM - 11:15 AM

New York PM Session

- Note: Specific TOIs not provided; traders should identify similar periods of interest.

How to Trade Using Macros

Trading Rules

1. SMR within TOI:

- If a Smart Money Reversal (SMR) occurs within a TOI, you can trade outside the TOI.
- The right side of the Market Maker Model will likely unfold next, allowing participation until the original consolidation is reached.

2. SMR outside TOI:

- If the SMR occurs outside a TOI, wait for the next TOI to execute trades.
- The upcoming TOI is expected to produce an expansion and deliver the right side of the Market Maker Model, allowing participation until the original consolidation is reached.

Entry Checklist

Steps to Frame Trades

- Follow this checklist to ensure you're prepared for high-probability trades:
 1. HTF Draw on Liquidity: Is it obvious?
 2. HTF Institutional Order Flow: Is it clear?
 3. HTF Point of Interest: Has price reached a level where you anticipate an SMR forming?
 4. Time Meets Price: Are they aligned?
 5. Smart Money Technique (SMT): Is there a signature present?
 6. Change in State of Delivery (CSD): Is it evident?
 7. Entry Model: Is it clearly defined?
 8. Invalidation Level: Have you established this?
 9. Targets: Are your target(s) defined?
 10. Execute: Proceed with the trade.

Key Takeaways

- **Macros:** Utilize specific timeframes for trading during key market sessions to enhance decision-making.
- **Trading Rules:** Understand the conditions under which to enter trades based on SMRs and TOIs.
- **Checklist:** Use the entry checklist as a systematic approach to ensure readiness and high probability in trades.

Time & Price

- Reading Order Flow Using Time Cycles"
- Introduction
- Purpose: To explore how time cycles govern market movements and provide insights into order flow.
- Core Idea: Time and price delivery in markets follow a fractal structure. Recognizing these patterns can elevate trading accuracy.
- Significance: Understanding algorithmic time and price alignment helps forecast market behavior.
- Foundational Concepts
 1. Time Cycles:
 - Time cycles are defined by the highs and lows of preceding cycles.
 - These levels serve as reference points for analyzing current market trends.
 - Timeframes: Applicable from yearly charts to intraday cycles.
 2. Order Flow Principles:
 - Bullish Order Flow:
 - Price should find support at the previous cycle's high after breaking above it.
 - Bearish Order Flow:
 - Price should face resistance at the previous cycle's low after breaking below it.
 3. Interbank Price Delivery Algorithm (IPDA):
 - An algorithmic model that governs price movements.
 - Key insights:
 - Breaks above/below a previous cycle's level act as early warnings of order flow shifts.

•

- **Applications**
- **Fractal Nature:**
 - The concept is consistent across all timeframes:
 - Higher Timeframes: Monthly, weekly, or daily cycles.
 - Intraday Timeframes: 90-minute cycles, sessions (Asia, London, New York).
 - Identifying high/low levels in these cycles provides actionable insights.
- **Intraday 90-Minute Cycles:**
 - **AM Session:**
 - 7:00–8:30 AM
 - 8:30–10:00 AM
 - 10:00–11:30 AM
 - **PM Session:**
 - 11:30 AM–1:00 PM
 - 1:00–2:30 PM
 - 2:30–4:00 PM
 - Each cycle exhibits accumulation, manipulation, and distribution phases.
- **Practical Observations:**
 - The December high and February low on the daily chart were critical benchmarks.
 - Price action respected these levels, confirming algorithmic delivery patterns.
- **Continuation vs. Reversal**
- **Continuation:**
 - Price respects the previous cycle's key levels (highs/lows).
 - Indicates sustained momentum in the prevailing direction.
- **Reversal:**
 - Failure to maintain the previous cycle's levels signals a potential change in direction.
 - Often accompanied by displacement (sharp moves breaking through significant levels).
-

- **Examples and Case Studies**
- **Daily Charts:**
 - Analyzed market behavior around yearly and monthly opens.
 - Observed how price reacts to previous cycle levels like December highs and February lows.
 - Example: Price retracted into an imbalance zone (low of February) and reversed, respecting algorithmic timing.
- **Intraday Analysis:**
 - **Example 1 (AM Session):**
 - Between 8:30–10:00 AM, price broke above the previous cycle high, then retraced.
 - Confirmed continuation as price respected the range and moved higher.
 - **Example 2 (PM Session):**
 - Price during 2:30–4:00 PM session retraced into the previous cycle's low before initiating a significant sell-off.
- **NFP Example:**
 - Despite volatile conditions during NFP week, the logic held.
 - **Key observations:**
 - Price retraced into predefined levels during specific cycles before continuing in the anticipated direction.
- **Critical Insights**
- **Algorithmic Time and Price Alignment:**
 - Movements occur at precise times, dictated by the interplay of previous cycle levels.
 - Timing is crucial in determining whether price will respect or breach a cycle's high/low.
- **Key Price Levels:**
 - Focus on previous cycle highs, lows, and equilibrium points (50% of the range).
 - These levels act as magnets for price and help gauge order flow direction.
- **Avoiding Noise:**
 - Volatility does not disrupt the foundational logic.
 - Patience and focus on alignment between time and price are key.
-

- **Practical Advice**
- **How to Implement:**
 - Always map out previous cycle highs/lows before trading.
 - Monitor price reactions to these levels during key time windows (e.g., 90-minute cycles).
 - Identify displacement and follow-through for confirmation.
- **Study and Practice:**
 - Review charts with a focus on cycle analysis.
 - Practice observing price behavior across different timeframes and sessions.
 - Consistency is the key to mastering this approach.
- **Conclusion**
- **Key Takeaway:** Understanding time cycles transforms how you view markets. The alignment of price and time is the foundation of algorithmic price delivery.
- **Next Steps:**
 - Study examples shared in this lecture.
 - Continuously refine your analysis by applying the concepts to live markets.
 - Be patient and allow time for these principles to become second nature.

It seems you're asking if you can watch daily execution videos of "Zeussy" on Twitter, but the context isn't clear. Could you please provide more details about what you're referring to by "Zeussy" or the kind of execution videos you're looking for? This will help me assist you better. 😊

You will find the concept of price in the next thread

i hope You enjoyed stay tuned.....
