

MASTER QUARTERLY THEORY

Quarterly Theory isn't just strategy.
It's the key to market cycles."

| what is Quarterly Theory?

- Quarterly theory is a framework that splits specific cycles of time into quarters. thus why it is called Quarterly Theory.
- Within these specific Quarters, we can expect specific characteristics that help us frame our trade ideas with a high degree of precision.
- By applying Quarterly Theory, it provides a high probability framework. It tells us when to trade by providing defined ranges in time, and where by time based price levels.

| TIME CYCLE (QT)

- **To understand Quarterly Theory, you must first understand the timings of each cycle and their corresponding quarters.**
- **Within Quarterly Theory there are many time cycles to refer to and each cycle is used for a different purpose. Our main focus for this Thread is to determine what kind of trader you are and in turn, determine which cycle you should be applying.**
- **Each cycle will correspond to what timeframe you're looking for. For example, the Weekly Cycle would be for intra-week traders, the Daily Cycle would be for intra-day traders, the 90m Cycle would be for intra-session, etc.**
- **As time and price is fractal, these cycles can be further multiplied or divided into quarters on a macro or micro scale.**

| TIME CYCLE

- **YEARLY CYCLE**

4 quarters — each quarter is 3 months.

- **MONTHLY CYCLE**

4 quarters — each quarter is 1 week.

- **WEEKLY CYCLE**

4 quarters — each quarter is 1 day (Monday to Thursday) Friday serves a unique purpose.

- **DAILY CYCLE**

4 quarters — each quarter is 6 hours, aligning with the 4 trading sessions of the day.

- **DAILY CYCLE**

4 quarters — each quarter is 90 minutes.

| MARKET CYCLE ?

AMDX/XAMD

A - Accumulation

M - Manipulation

D - Distribution

X-Reversal/Continuation

- Each quarter will serve a specific purpose. To anticipate what the next quarter will do, observe what the previous one has done.
- Typically, Q1 represents the accumulation stage. Moving into Q2, we often see manipulation take place. If that manipulation is confirmed, then Q3 usually unfolds as the distribution stage. By the time we reach Q4, the market will either continue in its current direction or reverse.

|AMDX EXAMPLE

I QUARTER MARKET CYCLE

Every quarter in the market tends to play its own role. By applying IF → THEN reasoning, we can get a sense of what the next quarter is most likely to bring.

IF Q1 shows Consolidation → THEN Q2 often brings Manipulation.

IF Q2 shows Manipulation → THEN Q3 tends to Distribute.

IF Q3 shows Distribution → THEN Q4 usually turns into either a Continuation or a Reversal.

I TRUE OPEN

Specific opens within price which serve as timed-based premium & discount, they can be used to gauge high probability stop hunts / judas swings.

- True Opens are the opening price of Q2 in every cycle.**
- High Probability PDAs will overlap with True Opens.**
