

Entry Model Simplified

@rahmath369

All You Need

Trade CheCklist

- **Clean Bias**
- **HTF Order Flow 15m**
- **Important Key Levels**
- **Macro Time**
- **Stop Hunt**
- **SMT**
- **Clean DOL (ERL)**
- **IFVG or Breaker for Entry**

All You Need to find high probability trade setups

What is Order Flow

Order Flow refers to the way buy and sell orders move in the market, influencing price action. It helps traders understand who is in control (buyers or sellers)

Order flow = market trend, but with a deeper focus on how price moves and where liquidity is positioned.

Why Order Flow is Important?

Who is in control? (Buyers or Sellers)

Order flow helps you determine whether buyers or sellers are in control, allowing you to trade with the TREND

Trade with the trend

If you trade against higher timeframe order flow, you are more likely to get wrecked. The higher timeframe dictates the main trend

If NQ is making higher highs with clean displacement candles and bullish FVGs being respected—ICT would say orderflow is bullish, and you'd look for buys at key levels like FVGs or breakers.

What Are Key Levels?

Markets are not moving randomly.

Key levels are areas where institutions and large traders engage in buying and selling.

These levels act as support and resistance, influencing price movements.

Price tends to react strongly at these key levels, which can indicate potential reversals, continuation of trends, or reaction points.

The only key level I am using for My Model

- **Order Block**
OB and CISD
- **Fair Value Gaps (FVGs)**
SIBI, BISI and IFVG
- **Breaker Block**
- **New Day Opening Gap**

Some Of ICT Macros (NY Time)

High Probability AM macro

07:50 – 08:10am

08:20 – 08:40am

08:50 – 09:10am

09:20 – 09:40am

09:50 – 10:10am

10:20 – 10:40am

10:50 – 11:10am

11:20 – 11:40am

High Probability PM macro

01:20 – 01:40pm

02:50 – 03:10pm

03:15 – 03:45pm

03:50 – 04:10pm

Macro time frames provide stronger price movements and confirmations.

In this model, setups mostly form inside the macro range, but sometimes they can form outside the macro as well.

What is Stop Hunt

An ICT Stop Hunt is a strategic price move—often a sharp spike—that targets areas where retail traders commonly place their stop-loss orders, such as just above resistance or below support levels.

Once these stops are triggered, the price often reverses direction, indicating that the move was primarily intended to capture liquidity rather than to continue a trend.

This tactic is frequently employed by institutional players to facilitate large trades with minimal slippage.

It's simply a lower time frame Liquidity Sweep

Draw On Liquidity (DOL)

Draw on Liquidity (DOL) is the side of the market the algorithm is targeting — either the buy-side or sell-side liquidity.

How to Identify the Draw on Liquidity

Look at

- **Relative equal highs/lows**
- **Previous day's high/low**
- **Previous sessions high/low**
- **Major swing highs/lows**
- **Imbalances (FVGs), OBs, BPRs**

Why It's Matters?

The Draw on Liquidity tells you the directional target.
You're not just looking for an entry — you're aiming for where
Smart Money wants to go.

- **If price is bullish, it's likely drawing to a buy-side liquidity pool**
- **If bearish, it's likely drawing to a sell-side liquidity pool**

CheCklist

1) Order Flow Alignment

M15 Order Flow must align with the trade direction.

2) Time

In this model, setups mostly form inside the macro range, but sometimes they can form outside the macro as well.

3) Premium / Discount PD Array

Shorts: Price must hit a premium PD array.

Longs: Price must hit a discount PD array.

4) Stop Hunt/SMT Check

Look for a stop hunt or SMT divergence to confirm liquidity sweep and possible reversal.

5) Entry Points Inversion Setup

Look for a stop hunt or SMT divergence to confirm liquidity sweep and possible reversal.

Bullish Scenario

When the candle closes above the IFVG high or Breaker high, wait for a reversal on the second candle.

You don't need the second candle to close — execute your trade on the same candle.

Bearish Scenario

When the candle closes Below the IFVG Low or Breaker Breaker, wait for a reversal on the second candle.

You don't need the second candle to close — execute your trade on the same candle.

Key Tips

- Aim for a 1:2 risk-to-reward ratio
- Place your stop below or above the IFVG (inversion) or the highs/lows of the unfilled FVG.
- Focus on 1/2 high-quality trades per day.
- One win done for the day or Two lose done for the day.
- Don't rush-wait patiently for the setup to form properly.
