

London Killzone is always liquidity

☪ The strategy conditions :

Why does ICT allow Monday to trade without him?

- 00:00 EST time of Monday of every week starts the new macro for the week.
- Wait for a dealing range to form:
 - Dealing range = Extreme high and low of the week.
 - Why does ICT always say Tuesday or Wednesday forms the high/low of the week? Yet, a lot of charter members have proven with statistics that Monday actually forms the extreme:
 - Monday will form one extreme, Tuesday or Wednesday usually forms the **OPPOSITE** extreme of the week.
 - Once the dealing range is set, find equilibrium of that range:
 - All trades for the remainder of the week will be based around those points.

• Liquidity hunting using London Kill zones:

- Admittedly, I don't know WHY they use London KZ highs and lows as liquidity targets, but I have found this to be true.
- Mark out London KZ highs and lows and extend them out for the remainder of the week.
 - If they are taken, delineate them by ending the line where they were taken or grey it out
- After the dealing range is formed, look for any pooled London KZ liquidities (close proximity) or if liquidity is just heavily favored to one side/ liquidity keeps getting taken on one side of the market.

Importance of economic news calendar and equilibrium:

- Look for that impactful news of the week, this will be your OSOK setup to target pooled liquidities.
- In the meantime, use equilibrium to frame your trades:
 - When price is in either premium or discount, price will always want to gravitate **TOWARDS** equilibrium:
 - Usually accumulates on either side.
 - However, when price is at or near equilibrium, it will always want to **REPEL** away from equilibrium:
 - Doesn't spend much time at equilibrium.

London Killzone is always liquidity

Seems pretty simple right? Let me demonstrate to you just how powerful this actually is...

London Killzone is always liquidity

London Killzone is always liquidity

Q/A :

Q: So is the dealing range defined by the extremes of Mon-Tues trading days or the current extreme high and low of the week as it stands?

A: It's the established extreme high and low, usually by Tues or early Wed (can be outside of KZ). Think about why ICT says time outside of KZ is dead time but he still notes the high and low of that range but nothing else. Once established, don't change it throughout the week. Even if it sweeps that liquidity, it's usually done on news manipulation and returns back inside the DR. Hope that makes sense.

I attached an example below of what I mean:

London Killzone is always liquidity

Question: so with what you are saying, would you view the London high from today-Monday 19- the DR High, or the Asia High? I would usually use the Asia high due to it taking a daily high, but would love to hear your ideas around this.

Answer: Asia high from 9.19.22 would be DR high. But LO low from 9.19.22 would be DR low since it's the start of the new week.

And when a new week starts you remove London liquidity from previous week and start fresh with Monday range.
