

NQ 15m Chart

This is where we start every morning. 15m Timeframe at 7am, looking for REHs or RELs to form in the chart. 7am is the time element. These signatures will repeat every week at this time. Anything before 7am is referring to London Session and its market profile. We don't need to be concerned with that right now, but London has characteristics that bleed over into NY. Is London Creating HOD or LOD? Consolidation to trend day? Trending day? Seek and Destroy?

NQ 5m Chart

NO REXs on the 15m chart, but we are about to form RELs on the 5m chart and a premium SIBI is in the chart. This can set up a potential trading scenario at market open. Although Caleb isn't focusing on anything before 7AM. We know that London Low is a great Liquidity pool that price will want to trade back into. The AM Session first characteristic always is to trade back into London Session (2-5am). London Highs and Lows especially are significant

2 Market Signatures

All I am looking for is smooth edges and jagged edges. Smooth edges will always be a great DOL and jagged edges will always be something to trade away from because the damage has been done. Notice here how we get displacement away from the jagged edge, setting up a 2022 model

7, 8, 9 AM

7-730, 8-830, 9-930. These times are pre-session ranges. I am looking for manipulation during these times, a false move opposing to what I expect to see in price. It doesn't have to be super precise with these times, but this is what I am keyed up on and if it is in the charts it heightens probability. Today 7-730, 8-830, 9-930 all created moves away from the DOL (Judas swing). The algorithm is doing the damage and setting traders offside during these times. These are the signatures of TIME that will be there every single day. They will repeat because it's coded to do so based on time first.

The Importance of Journaling

Journaling is paramount to developing traders, and this aspect of my trading must be done if I want to improve. Journaling is the "work" that is required. I can't measure any of my progress accurately if it is never recorded.

How to Journal: Take screenshots and write my observations over that chart, and positively record that price run like I saw it coming in advance. In my journal I am acting as I would coach my own son or daughter, I want them to succeed and build them up and keep them on the right track. I must respect myself when it comes to journaling. I don't beat myself up in my journal, but I build myself up.

The Importance of Slowing Down

The biggest obstacle that is in my way, is myself, and most importantly my own expectations that I have for myself. I trade to make money, but I have to let myself develop over time. What if it takes me 3 years to get there? Trying to rush it to happen before I am really ready can cause me much more pain and heartache, rather than removing my ego and recognizing that trading takes time. The hardest thing is to be content with what I have done because there are so many opportunities to do more. Real growth in my trading is to be content with enough and then stepping away and having a life outside of the markets.

- I am content with enough.
- I am content with one model
- I am content with losing outcomes in my trading.

Trading Properly

When I am in a trade I should be focused on the trade and on price action rather than the money. Gamblers focus on the money and they never stop when they are up money, only when it is all gone. As a trader, I can act the same way as a gambler if I am not focused and aware of my emotions. Everything can be minimized if I slow down, study charts, tape read, log and journal and then transition into 1 micro contract. Trading with too much leverage is asking myself to go mental and to chase the money. Here are questions I must be asking when I am in a trade.

What is price action doing right now? Instead of What do I feel right now?

Am I in control of myself when in a trade?

Am I in control of my emotions when in a trade?

Am I managing everything soberly?

Am I using proper Risk?

Do I care too much about this 1 outcome?

Am I following a trading model?

Including Volume Imbalances in Fair Value Gaps

A V.I. is a super strong array that will need to be priced back to and it highlights the true range of inefficiency. It must be included. It is very pleasing to see the precision elements to FVGs repeat time and time again.)

Smooth Lows Delivered:

Very Pleased to see the DOL that I was looking for deliver and entries offered into that level. At 9:30 where is the smooth edge? it is obvious? If it is not obvious then it shouldn't be traded or forced. Today the smooth lows were way too clean and clear.

Gauntlet IFVG

The IFVG in the stop hunt leg is very important and will be favored to trade into over the breaker

Focusing on Institutional Orderflow

The best way to stay onside is to stick to underlying orderflow without trying to pick tops and bottoms. If I focus on SIBIs when price is bearish or the highs have been made jagged like here, I am setting myself up for success. This is the only thing I need to focus on right now. Just this I also want to note every **STH** when bearish. These will be turtle soups if price runs above them. The market moves from FVG to liquidity. These 2 signatures make up the market.

Extending Fair Value Gaps

FVGs are never one and done and these levels will be used again by the algorithm. Whatever was used on the left side of the curve will be utilized on the right side of the curve. Sometimes price sweeps above and below these levels, and I don't expect there to always be perfect respect to the High, Low, and C/E of those levels

Tape Reading Exercise

Here is a long entry after London Low has been taken. The displacement back into the range gives me confidence that this is a Judas swing lower and 9:50 macro will reverse price. I am allowing for the lower FVG to be traded into, but I am entering in on the more premium gap not needing the perfect fill. Needing to be perfect or needing to win a trade is toxic and poison to my trading

Standard Deviations

ICT is utilizing SD. He is drawing it from the highest high to the open of the hourly candle. Here we are seeing 1hr PO3

The Importance of PO3

PO3 is in the chart every day and it has to be there. In order for a market to drop lower it has to have gone higher first. Every single hour and session there is going to be a PO3 move. If I am aware of these opening prices, I can be more alert to the manipulation that is happening above or below opening prices. SDs are mathematically derived projections on where price could go. I always want a PD array to align with a projection and I don't want to cherry pick a projection either. Here Sellside liquidity, (London Low) aligns with discount projections

NQ 1m Chart

The 7am high, is the DOL, I expect this to be an IRB as it is happening in the 1m IFVG. I want to see the lower gap stay open and price easily trade into the smooth highs and Buyside liquidity from 7am

ICT Draws the Line on the OB

ICT points out the immediate rebalance, but draws the line on the 1m OB.

Price Delivery Continuum Theory

The algorithm starts from a HTF and will provide an entry on that timeframe. As it starts moving away from that entry point on the HTF, LTF entry points will be there until price reaches its objective. Since the market doesn't move in a straight line, but uses FVGs, OBs, and other arrays it has to continuously offer me entries until it reaches where it deems fair value

Market Narrative

Everyday there is a narrative to capture and trap the uninformed and to move from FVG to liquidity. Where can they stop people out and go the other direction? The market is not moving randomly, it is scripted and coded
